SPECIFICATIONS

Deck system	Stereo cassette deck
Track system	4-track, 2-channel
Heads	
REC/PLAY	Combination head
Erasing	Double-gap ferrite head
Motors	
Capstan	Electronically controlled DC motor
Reel table drive	Electronically controlled DC motor
Recording system	AC bias
Bias frequency	85 kHz
Erasing system	AC erase
Tape speed	4.8 cm/sec. (1-7/8 ips)
Frequency response	
METAL	20 Hz~22 kHz (±15 dB) 30 Hz~21 kHz (DIN)
CrO ₂	20 Hz~21 kHz (±15 dB) 30 Hz~20 kHz (DIN)
NORMAL	20 Hz~20 kHz (±15 dB) 30 Hz~19 kHz (DIN)
Dynamic Range (with dbx on)	110 dB (1 kHz)
Max. Input level improvement (with dbx on)	10 dB
S/N	(signal level = max recording level, CrO ₂ type tape)
dbx on	92 dB (A weighted)
Dolby C NR on	75 dB (CCIR)
Dolby B NR on	67 dB (CCIR)
NR off	57 dB (A weighted)

Wow and flutter 0.04% (WRMS)
±0.12% (DIN)

Fast Forward and Rewind Time
Approx. 95 seconds with C-60 cassette tape

Input sensitivity and impedance
LINE 60 mV/47 kΩ

Output voltage and impedance
LINE 400 mV/2.2 kΩ
HEADPHONES 125 mV/8 Ω

■ GENERAL

Power consumption 25W
Power supply

For U.S.A. and Canada AC 60Hz, 120V

For continental Europe AC 50Hz/60Hz, 220V

For United Kingdom and other area
AC 50Hz/60Hz, 110V/12V/220V/240V

Dimensions (W × H × D) 430 × 25 × 109.5mm
(16-15/16" × 11-7/32" × 4-5/16")
Weight 5 kg (11 lb.)

SAFETY PRECAUTION (This "safety precaution" is applied only in U.S.A.)

1. Before servicing, unplug the power cord to prevent an electric shock.
2. When replacing parts, use only manufacturer's recommended components for safety.
3. Check the condition of the power cord. Replace if wear or damage is evident.
4. After servicing, be sure to restore the lead dress, insulation barriers, insulation papers, shields, etc.
5. Before returning the serviced equipment to the customer, be sure to make the following insulation resistance test to prevent the customer from being exposed to a shock hazard.

INSULATION RESISTANCE TEST

1. Unplug the power cord and short the two prongs of the plug with a jumper wire.
2. Turn on the power switch.
3. Measure the resistance value with ohmmeter between the jumpered AC plug and each exposed metal cabinet part, such as screwheads antenna, control shafts, handle brackets, etc. Equipment with antenna terminals should read between $3M\Omega$ and $5.2M\Omega$ to all exposed parts. (Fig. A) Equipment without antenna terminals should read approximately infinity to all exposed parts. (Fig. B)

Note: Some exposed parts may be isolated from the chassis by design. These will read infinity.

(Fig. A)

Resistance = $3M\Omega$ — $5.2M\Omega$

(Fig. B)

Resistance = Approx ∞

4. If the measurement is outside the specified limits, there is a possibility of a shock hazard. The equipment should be repaired and rechecked before it is returned to the customer.

TECHNICAL GUIDES

Dolby HX Pro-Head Room Extension System

To record good quality sound, it is necessary to give bias current to the head. The bias current has characteristics as follows:

- Increasing the bias current reduces the distortion in low-frequency range but lowers the recording level in high-frequency range.
- Decreasing the bias current improves the recording level in high-frequency range but increases the distortion in low-frequency range.

In the case of a common deck, a specific level of bias current is determined according to the characteristics of recording head. Therefore, bias current cannot be applied to the head according to the frequency levels of music signal.

In order to solve such problems, this unit employs "Dolby HX-Pro". It picks up the high frequency of music source changing at all times, and controls the bias current level according to the changing frequency. It serves to make the bias current level then most suited for the music source.

This system always operates in recording mode irrespective of the noise reduction system, but the dynamic range in record/playback can be further increased by using this system in combination with a noise reduction system. Particularly, combination with the dbx NR system mounted in this unit will double the MOL (Maximum Output Level) in high frequency range, which is suited for the record/play-back of digital source as in CD.

Dolby HX Pro System (NORMAL)

Record Calibration/Bias Control Function

There are sometimes differences in playback output level even in case of same recording level or in sound quality even in case of same recording source. This is because the characteristics of the cassette tape used are different with the makers and brands.

To solve this problem, this unit is furnished with a record calibration knob and bias control knob.

These knobs can be used to adjust the sound volume and quality while comparing the music signal (original sounds of record and tuner) and recorded signal (sound recorded on tape).

The comparison by hearing can be done by only one monitor switch because this unit is of 3-head type with record, playback and erase heads.

• Record calibration knob

Used to calibrate the difference in recording level of music signal and recorded signal.

• Bias control knob

Used to correct the high-frequency sound quality of music signal and recorded signal.

In this way, the record characteristics will not be distorted by tape, and the characteristics can be kept nearly uniform.

<class AA> Circuit Recording Equalizer Amp

Recording equalizer amp is an amplifier to supply recording current to the head. Usually, loads such as recording head and bias trap circuit (bias current control circuit) are added to the amplifier. Therefore, the current phase and voltage phase are fluctuated causing the recording signal to be distorted. This unit employs "class AA" amp in which two types of amplifier circuits (voltage control amp and current supply amp) different in amplifying system. This recording equalizer amplifier is not influenced by the fluctuation of current phase or voltage phase as mentioned above, and is excellent in waveform response.

Operation Principles of Noise Reduction System

● Dolby NR B type, C type

The level of hiss noise generated during playback is constant. So, it is more offensive to the ear when the music signal level is lower.

Accordingly, raising the signal level during recording and lowering the level during playback will result in reduction of noise generated by the tape.

Dolby NR B type does it in high frequency range, and C type, in high and medium frequency ranges.

● dbx NR

Cassette tape is low in saturation level (limit of recording level). Therefore, distortion will be generated if music signal with large dynamic range (ratio of sound volumes of the weakest sound and the strongest sound) is recorded as it is.

dbx NR halves the music signal during recording and doubles it during playback.

In this way, dynamic range as large as 110dB and noise reduction effect as high as 30dB can be obtained, and good quality sound can be recorded even in case of music source with dynamic range as in CD and live performance.

MPX Filter

If FM stereo broadcast is recorded by dolby NR, then the pilot signal included in the broadcast is also processed by dolby NR as music signal, causing deterioration of sound quality and worsening of noise reduction effect.

To solve this problem, this unit is furnished with MPX filter switch to cut off the pilot signal.

It serves to cut off the 19kHz single frequency of the pilot signal, which is different from a high cut filter installed in an amplifier, etc.

Also, MPX filter hardly causes change of sound quality in a sense of hearing.

(When recording a source other than FM broadcast, set this switch to off (■ → ■) position.)

Pilot signal

This signal is used to separate FM broadcast into L (left) and R (right) channels, which is emitted at 19kHz very close to the music frequency band.

Monitor Switch

In order to avoid faulty recording such as low sound level or distortion, it is very important to monitor the state of recording.

In the case of a common deck (2-head type), the sound that can be monitored during recording is always the sound before recording. So, when checking the state of actual recording, you have to rewind the tape and play it back.

This unit is of 3-head type, and the record head is independent of the playback head. Also, the sound before recording can be compared with the recorded sound by use of the monitor switch, therefore the state of recording can be easily checked.

Head care

To assure sound quality for recording and playback, be sure to clean the heads after approximately every 10 hours of use.

- 1) Press the power switch to switch off the electrical power supply of the cassette tape deck.
- 2) Press the eject button to open the cassette holder.
- 3) Clean the heads, pinch roller and the capstan shaft with a cotton swab (or with a soft, lint-free cloth) slightly moistened with alcohol.

Do not use any solution other than alcohol for head cleaning.

Head demagnetization

In order to maintain good sound quality during recording and playback, it is recommended that the head assembly be demagnetized when distortion or poor sound quality persist after cleaning the heads.

If the head assembly becomes magnetized, it could create noise in the recordings, loss of high-frequency response or erasure of valuable recordings. Several types of head demagnetizers are available and may be purchased separately at local electronics supply stores. Follow the instructions that are supplied with the device.

• Do not bring any type of metal objects or tools such as magnetic screwdrivers in contact with the head assembly.

Maintenance of external surfaces

To clean this unit, use a soft, dry cloth.
If the surfaces are extremely dirty, use a soft cloth, dipped into a soap-and-water solution or a weak detergent solution. Wring the cloth well before wiping the unit.
Wipe once again with a soft, dry cloth.
Never use alcohol, paint thinner, benzine, nor a chemically treated cloth to clean this unit.
Such chemicals may damage the finish of your unit.

DISASSEMBLY INSTRUCTIONS

"ATTENTION SERVICER"

Some chassis components may have sharp edges. Be careful when disassembling and servicing.

Ref. No. 1	How to remove the cabinet	Ref. No. 3	How to remove the FL meter P.C.B.
Procedure 1	• Remove the 5 screws.	Procedure 1→3	• Remove the 4 screws (1~4), and then remove the angle. • Pull out the input level control knob and the balance control knob. • Remove the 2 screws (5, 6). • Push the 2 tabs.
Ref. No. 2	How to remove the power P.C.B. and the main P.C.B.		
Procedure 1→2	• Remove the connection rod. • Remove the 5 screws (6~10). • Remove the power P.C.B. • Remove the 5 screws (1~5). • Remove the main P.C.B.		

Fig. 1

Fig. 2

Ref. No. 4	How to remove the timer P.C.B. and the bias adjust/recording calibration control P.C.B.	Ref. No. 7	How to remove the operation switch P.C.B.
Procedure 1→2→3→4	• Remove the screw (3) and then the timer P.C.B. • Remove the 2 screws (1, 2). • Pull out the bias adjust knob. • Remove the bias adjust/recording calibration control P.C.B.	Procedure 1→7	• Remove the 5 screws (1~5)

Fig. 3

Fig. 5

Ref. No. 5	How to remove the mechanism unit
Procedure 1→5	• Remove the screw (6) (See the Fig. 5). • Remove the 5 screws (1~5). • Push the eject button.

Fig. 4

- Remove the screw (7).
- Pull out the input level control knob and the balance control knob. (See the Fig. 2).
- Push the 3 tabs (8) and then remove the front panel.
- Push the 2 tabs (9).

Fig. 6

Ref. No. 6	How to remove the headphones P.C.B.
Procedure 1→6	• Remove the 2 screws (6, 7). (See the Fig. 4). • Pull out the headphones volume control knob. (See the Fig. 4).

MEASUREMENT AND ADJUSTMENT METHODES

Measurement Condition

- Input level controls; Maximum
- Timer start switch; Off
- Noise reduction select switch; Off
- Repeat-play switch; Off
- Multiplex filter switch; Off
- Make sure heads are clean
- Make sure capstan and pressure roller are clean
- Judgeable room temperature $20 \pm 5^\circ\text{C}$ ($68 \pm 9^\circ\text{F}$)

Measuring instrument

- EVM(Electronic Voltmeter)
- Oscilloscope
- Digital frequency counter
- AF oscillator
- ATT(Attenuator)
- DC voltmeter
- Resistor (600Ω)

Test tape

- Head azimuth adjustment (8kHz, -20dB); QZZCFM
- Tape speed adjustment (3kHz, -10dB); QZZCWAT
- Playback frequency response (315Hz, 12.5kHz, 10kHz, 8kHz, 4kHz, 1kHz, 250Hz, 125Hz, 63Hz, -20dB); QZZCFM
- Playback gain adjustment (315Hz, 0dB); QZZCFM
- Overall frequency response, Overall gain adjustment
- Normal reference blank tape; QZZCRA
- CrO₂ reference blank tape; QZZCRX
- Metal reference blank tape; QZZCRZ

HEAD AZIMUTH ADJUSTMENT

1. Playback the azimuth adjustment portion (8 kHz, -20 dB) of the test tape (QZZCFM). Vary the azimuth adjusting screw until the outputs of the L-CH and R-CH are maximized and the lissajous waveform, as illustrated, approaches 0 degrees.

Note: If L-CH and R-CH are not maximized at the same point, adjust to the point where the levels of each channel are maximized and equal.

2. Perform the same adjustment in the play mode.

TAPE SPEED ADJUSTMENT

1. Playback the middle portion of the test tape (QZZCWAT).
2. Adjust the **VR** in the motor (see Fig. 3) so that the output is within the standard value.

Standard value: 3000 ± 15 Hz

PLAYBACK GAIN ADJUSTMENT

1. Playback the gain adjusted portion (315 Hz, 0 dB) of the test tape (QZZCFM).
2. Adjust VR1 (L-CH) and VR2 (R-CH) so that the output is within the standard value.

Standard value: $0.4\text{V} \pm 0.5\text{dB}$

PLAYBACK FREQUENCY RESPONSE

1. Playback the frequency response portion (315 Hz, 12.5 kHz ~ 63 Hz, -20 dB) of the test tape (QZZCFM).
2. Assure that the frequency response is within the range shown in Fig. 6 for both L-CH and R-CH.

FLUORESCENT METER ADJUSTMENT

1. Insert the Normal blank test tape (QZZCRA) and apply a reference input signal (1 kHz, -24 dB) in the Record Pause mode.
2. Using an attenuator, adjust it until the voltage of the tape decks "LINE OUT" terminals is 0.4V.

-40 dB ADJUSTMENT

3. Attenuate the signal input level in step 1, by 40 dB and apply it to the unit.
4. Adjust VR61 so that the "-40 dB" segment is slightly illuminated.

0 dB ADJUSTMENT

5. Set the input signal level as indicated in step 2 above.
6. Adjust VR62 so that the "0 dB" segment is slightly illuminated.
7. Repeat steps 1 ~ 6 above and assure that both the -40 dB and 0 dB segments illuminate slightly.

Fig. 7

OVERALL FREQUENCY RESPONSE

1. Insert the Normal blank test tape (QZZCRA) and set the unit to the Record Pause mode.
2. Apply a reference input signal (1 kHz, -24 dB) through an attenuator.
3. Attenuate the signal by 20 dB and adjust the frequency from 50 Hz ~ 15 kHz.
4. Record the frequency sweep.
5. Playback the recorded signal and assure that it is within the range shown in Fig. 9 in comparison to the reference frequency (1 kHz).
6. If it is not within the standard range, adjust VR301 (L-CH) and VR302 (R-CH) so that the frequency level is within the standard range.
● Level up in high frequency range.....Increase the bias current.
● Level down in high frequency range...Decrease the bias current.
7. Repeat steps 2 ~ 6 above using the CrO₂ tape(QZZCRX) and the Metal tape(QZZCRZ) increasing the frequency range to 16 kHz (50Hz~16kHz).
8. Assure that the level is within the range shown in Fig. 10.

Fig. 9

Fig. 10

Fig. 8

OVERALL GAIN ADJUSTMENT

1. Insert the Normal blank test tape (QZZCRA) and set the unit to the Record pause mode.
2. Apply a reference input signal (1 kHz, -24 dB). Attenuate the output so that its level becomes 0.4V.
3. Record this input signal.
4. Playback the signal recorded in step 3 above, and assure that the output is within the standard value.
5. If it is not within the standard value, adjust VR151 (L-CH) and VR152 (R-CH).
6. Repeat the step 2 ~ 5 above until the output is within the standard value.

Fig. 11

Standard value: $0.4\text{V} \pm 0.5\text{dB}$

1. Insert the Metal blank tape (QZZCRZ) and set the unit to the Record Pause mode.
2. Connect a DC voltmeter across R325 (L-CH., 10 ohms) and R326 (R-CH., 10 ohms).
3. Adjust L303 (L-CH) and L304 (R-CH) so that the voltage becomes less than 110mV DC.

ENCODE SIDE

1. Set the noise reduction switch to the dbx position.
2. Apply a 1 kHz signal to LINE IN terminals through an attenuator.
3. Connect an AC voltmeter across R565 (L-CH) and R566 (R-CH). Adjust the input signal level so that the voltage is 20 mV.
4. Connect a DC voltmeter across R550 (TP551) and adjust VR551, so that the voltage becomes 15 mV.

DECODE SIDE

5. Repeat steps 1 and 2 above.
6. Connect an AC voltmeter across R515 (L-CH) and R516 (R-CH). Adjust the input signal level so that the voltage is 20 mV.
7. Connect a DC voltmeter across R500 (TP501) and adjust VR501 so that the voltage becomes 15 mV.

1. Insert the Normal blank test tape (QZZCRA) and set the unit to the Record mode.
2. Apply a 1 kHz signal to the "LINE IN" through an attenuator.
3. Adjust the input level so that the meter reading is 0 dB.
4. Connect an AC voltmeter to the "LINE OUT" terminal.
5. Switch the Monitor switch position between "TAPE" and "SOURCE". Adjust VR553 (L-CH) and VR554 (R-CH) so that the voltage difference at "LINE OUT" is within 0.5 dB.

The diagram illustrates the HX PRO circuit board, divided into two main sections. The top section contains the main processing and output stages, while the bottom section shows the tape speed adjustment and timing components.

Top Section Components and Adjustments:

- dbx Timing TEST POINT TP551:** Located at the top left, connected to R565 (Rch) and R566 (Lch).
- dbx Gain adj.:** Includes VR553 (Lch) and VR554 (Rch).
- Overall Gain adj.:** Includes VR151 (Lch) and VR152 (Rch).
- FL Meter adj.:** Includes VR62 (0 dB) and VR61 (-40 dB).
- TP305:** Test point connected to R325 (Lch) and HX PRO TEST POINT.
- TP306:** Test point connected to VR2 (Rch) and VR1 (Lch).
- Playback Gain adj.:** Includes VR2 (Rch) and VR1 (Lch).
- VR551 dbx Timing adj. (Encoder):** Located at the bottom left.
- HX PR0 adj.:** Includes L303 (Lch) and L304 (Rch).
- Overall Frequency Response adj.:** Includes VR301 (Lch) and VR302 (Rch).

Bottom Section Components and Adjustments:

- Tape speed adj.:** A potentiometer located at the bottom left.
- dbx Timing TEST POINT TP501:** Located at the top of the bottom section, connected to R516 (Rch) and R500.
- VR501 dbx Timing adj. (Decoder):** Located at the bottom right.

REPLACEMENT PARTS LIST

Notes: * Important safety notice:

Components identified by Δ mark have special characteristics important for safety. When replacing any of these components use only manufacturer's specified parts.

* Bracketed indications in Ref. No. columns specify the area.

Parts without these indications can be used for all areas.

SCHEMATIC DIAGRAM

(This schematic diagram may be modified at any time with the development of new technology.)

Note:

- S601 : Power switch in "off" position.
- S602 : Voltage selector switch in "240V" position.
(EK, XA, (110V — 127V — 220V — 240V) XB, XL)
- S701 : Stop switch in "off" position.
- S702 : Record switch in "off" position.
- S703 : Pause switch in "off" position.
- S704 : Record-muting switch in "off" position.
- S705 : Play switch in "off" position.
- S706 : Fast-forward mode switch in "off" position.
- S707 : Rewind switch in "off" position.
- S708 : Timer stand-by switch in "off" position.
(rec — off — play)
- S709 : Counter reset switch in "off" position.
- S710 : Monitor switch in "off" position.
- S741 : Multiplex filter switch in "off" position.
- S742 : Repeat-play switch in "off" position.
- S752 : Noise-reduction DOLBY B mode switch in "off" position.
- S753 : Noise-reduction DOLBY C mode switch in "off" position.
- S754 : Noise-reduction dbx mode switch in "off" position.
- S901 : Metal/CrO₂ switch in "off (Metal)" position.
- S902 : Rec INH switch in "off" position.
- S903 : Pack switch in "off" position.
- S904 : 70μ/120μ selector switch in "off (70μs)" position.
- Resistance are in ohms (Ω), 1/4 watt unless specified otherwise.
1K=1,000 (Ω), 1M=1,000k (Ω)
- Capacity are in micro-farads (μF) unless specified otherwise.
- All voltage values shown in circuitry are under no signal condition and playback mode with volume control at minimum position otherwise specified.
- () ...Voltage values at record mode.
- (—) indicates B (bias).
- (→) indicates the flow of the playback signal.
- (→) indicates the flow of the record signal.
- Important safety notice
Components identified by Δ mark have special characteristics important for safety. When replacing any of these components, use only manufacturer's specified parts.

* Caution!

- IC and LSI are sensitive to static electricity. Secondary trouble can be prevented by taking care during repair.
- * Cover the parts boxes made of plastics with aluminum foil.
- * Ground the soldering iron.
- * Put a conductive mat on the work table.
- * Do not touch the legs of IC or LSI with the fingers directly.

SPECIFICATIONS *Input level control...MAX

Playback S/N ratio *Test tape...QZZCFM	Greater than 45dB
Overall distortion *Test tape ...QZZCRA for Normal ...QZZCRX for CrO ₂ ...QZZCRZ for Metal	Less than 4%
Overall S/N ratio *Test tape ...QZZCRA	Greater than 43dB (without NAB filter)

dbx/ Closed Loop Dual Capstan DOUBLE DOLBY SYSTEM

DEUTSCH

Verwenden Sie bitte diese Broschüre Zusammen
mit der Service-Anleitung für das Modell Nr.
RS-B905

■ MESSUNGEN UND EINSTELL METHODEN

Meßinstrumente

- Elektronisches Voltmeter(EVM)
- Oszilloskop
- Digitaler Frequenzmesser
- Audiofrequenz-Oszillator
- Dämpfungswiderstand
- Gleichstrom-Voltmeter
- Widerstand (600Ω)

Tonkopf-Azimuteinstellung

1. Spielen Sie auf dem Testband (QZZCFM) den Teil für die Azimuteinstellung (8 kHz, -20dB) ab. Drehen Sie die Azimuteinstellschraube so lange, bis die Abgaben des L-K und R-K den Höchstwert erreichen, und die Lissajoscghe wellenfigur sich, wie abgebildet, 0 Grad nähert.

Anmerkung:

When L-K und R-K nicht auf demselben Punkt ihren Höchstwert erreichen, stellen Sie beide Kanäle auf den jeweiligen Höchstwert und gleichen dann aus.

2. Nehmen Sie denselben Einstellvorgang in der Wiedergabestellung vor.

Abb. 1

Abb. 2

Bandgeschwindigkeitseinstellung

1. Spielen Sie den Mittelteil des Testbands (QZZCWAT) ab.
2. Stellen Sie den VR im Motor (Siehe Abb. 3) so ein, daß die Abgabe den Normwert erfüllt.

Normwert: 3000 + 15, -10Hz

Abb. 3

Einstellung der Wiedergabeverstärkungsregelung

1. Spielen Sie auf dem Testband (QZZCFM) den Teil für die Einstellung der Verstärkungsregelung (315 Hz, 0 dB) ab.
2. Stellen Sie VR1 (L-K) und VR2 (R-K) so ein, daß die Abgabe den Normwert erfüllt.

Normwert: 0.4V ± 0.5dB

Abb. 4

Wiedergabefrequenzaang

1. Spielen Sie auf dem Testband (QZZCFM) den Teil für den Frequenzgang (315 Hz, 12,5 kHz ~ 63 Hz, -20 dB) ab.
2. Achten Sie darauf, daß der Frequenzgang für beide Kanäle (L-K, R-K) in dem in **Abb. 6** gezeigten Bereich liegt.

Abb. 5

Abb. 6

Fluoreszenzanzeigeneinstellung

1. Legen Sie das normale Leertestband (QZZCRA) ein und geben bei Aufnahme-/Pause-Betrieb ein Bezugseingabesignal (1 kHz, -24 dB) ein.
2. Verwenden Sie einen Lautstärkeregler und stellen Sie diesen so ein, daß an den "LINE OUT"-Anschlüssen des Kassettendecks 0,4 V anliegen.

-40 dB Einstellung

3. Stellen Sie den Signaleingabepiegel aus Schritt 1 auf 40 dB und geben das Signal ins Gerät ein.
4. Justieren Sie **VR61** so, daß der "-40 dB"-Abschnitt der Anzeige schwach aufleuchtet.

0 dB Einstellung

5. Stellen Sie den Pegel des Eingabesignals wie in Schritt 2 oben beschrieben ein.
6. Justieren Sie **VR62** so, daß der "-0 dB"-Abschnitt der Anzeige schwach aufleuchtet.
7. Wiederholen Sie die Schritte 1 ~ 6 und achten darauf, daß der -40 dB und 0 dB Anzeigenabschnitt schwach aufleuchten.

Abb. 7

Gesamtfrequenzgang

1. Legen Sie das normale Leertestband (QZZCRA) ein und stellen das Gerät auf Aufnahme-/Pause-Betrieb.
2. Geben Sie über einen Lautstärkeregler ein Bezugseingabesignal (1 kHz, -24 dB) ein.
3. Stellen Sie das Signal auf 20 dB und justieren die Frequenz von 50 Hz ~ 15 kHz.
4. Nehmen Sie das Wobbelsignal auf.
5. Geben Sie das aufgenommene Signal wieder und achten darauf, daß dieses sich im Vergleich zur Bezugsfrequenz (1 kHz) in dem in **Abb. 9** aufgezeichneten Bereich befindet.
6. Sollte das Signal nicht im Normbereich liegen, justieren Sie **VR301** (L-K) und **VR302** (R-K) so, daß der Frequenzpegel mit der Norm übereinstimmt.
 - Nach oben im Hochfrequenzbereich ausgleichen....Den vormagnetisierungsstrom anheben.
 - Nach unten im Hochfrequenzbereich ausgleichen...Den vormagnetisierungsstrom senken.
7. Wiederholen Sie die Schritte 2 ~ 6 und verwenden das CrO₂ Band (QZZCRX) und das Metallband (QZZCRZ). Der Frequenzbereich wird auf 16 kHz (50 Hz ~ 16 kHz) angehoben.
8. Achten Sie darauf, daß sich der Frequenzpegel in dem in **Abb. 10** aufgezeigten Bereich befindet.

Abb. 8

Abb. 9

Abb. 10

Einstellung der Gesamtverstärkungsregelung

1. Legen Sie das normale Leertestband (QZZCRA) ein und stellen das Gerät auf Aufnahme-/Betrieb.
2. Legen Sie ein Bezugseingabesignal (1 kHz, -24 dB) an. Stellen Sie das Ausgangssignal auf einen Pegel von 0.4 V ein.
3. Nehmen Sie das Eingabesignal auf.
4. Geben Sie das in Schritt 3 oben aufgenommene Signal wieder und achten Sie darauf, daß das Ausgangssignal mit dem Normwert übereinstimmt.
5. Sollte der Wert nicht innerhalb der Norm liegen, justieren Sie **VR151** (L-K) und **VR152** (R-K).
6. Wiederholen Sie die Schritte 2 ~ 5 von oben so lange, bis das Ausgangssignal im Normbereich liegt.

Normwert: 0.4V ± 0.5dB

Abb. 11

HX-PRO Einstellung

1. Legen Sie das Metalleertestband (QZZCRZ) ein und stellen das Gerät auf Aufnahme-/Pause-Betrieb.
2. Schalten Sie ein Gleichspannungsvoltmeter parallel zu **R325** (L-K, 10Ω) und **R326** (R-K, 10Ω).
3. Stellen Sie **L303** (L-K) und **L304** (R-K) so ein, daß die Spannung < 110 mV Gleichspannung beträgt.

dbx Synchronisierung

Kompressionsseite

1. Stellen Sie den Rauschunterdrückungswählschalter in die dbx Stellung.
2. Legen Sie ein 1 kHz Signal an die "LINE IN"-Anschlüsse durch einen Lautstärkereger.
3. Schalten Sie ein Wechselspannungsvoltmeter parallel zu **R565** (L-K) und **R566** (R-K). Justieren Sie den Eingabesignalpegel so, daß die Spannung 20 mV beträgt.
4. Schalten Sie ein Gleichspannungsvoltmeter parallel zu **R550** (TP551) und justieren **VR551** so, daß die Spannung 15 mV beträgt.

Expansionsseite

5. Wiederholen Sie Schritt 1 und 2.
6. Schalten Sie ein Wechselspannungsvoltmeter parallel zu **R515** (L-K) und **R516** (R-K). Justieren Sie den Eingabesignalpegel so, daß Spannung 20 mV beträgt.
7. Schalten Sie ein Gleichspannungsvoltmeter parallel zu **R500** (TP501) und justieren **VR501** so, daß die Spannung 15 mV beträgt.

Abb. 13

TPA { TP551 (ENCODE)
TP501 (DECODE) }

TPB { R550 (ENCODE)
R500 (DECODE) }

Einstellung der dbx Verstärkungsregelung

1. Legen Sie das normale Leertestband (QZZCRA) ein und stellen das Gerät auf Aufnahme-Betrieb.
2. Legen Sie ein 1 kHz Signal an die "LINE IN"-Anschlüsse durch einen Lautstärkereger.
3. Justieren Sie den Eingabepegel so, daß die Anzeige 0 dB anzeigt.
4. Schließen Sie ein Wechselspannungsvoltmeter an den "LINE OUT"-Anschlüsse.
5. Schalten Sie den Monitorbetriebsartschalter von "TAPE" auf "SOURCE". Justieren Sie **VR553** (L-K) und **VR553** (R-K) so, daß die Spannungsdifferenz am "LINE OUT"-Anschluß ≈ 0.5 dB ausmacht.

Abb. 14

FRANÇAIS

Ceci est à utiliser conjointement avec manuel d'entretien du modèle No. RS-B905

METHODES DES MEASURES ET REGLAGES

Appareils de mesure

- Voltmètre électronique
- Oscilloscope
- Compteur de fréquence numérique
- Oscillateur de fréquence audio
- A.T.T.(Atténuateur)
- Voltmètre à C.C.
- Résistance (600Ω)

Reglage Azimutal de la tete

1. Faire jouer la portion du réglage de l'azimuth (8 kHz, -20 dB) de la bande d'essai (QZZCFM). Ajuster la vis de la mise au point azimutale jusqu'à ce que les sorties du canal de gauche et du canal de droite soient maximisées et que la forme d'onde de Lissajous, comme il est illustré, approche de 0 degré.

Nota:

Si le canal de gauche et canal de droite ne sont pas maximisés au même point, régler le point où les niveaux de chaque canal sont maximisés et égaux.

2. Effectuer le même réglage sur le mode d'audition.

Fig. 1

Fig. 2

Reglage de la Vitesse de Defilement

1. Faire jouer la portion médiane de la bande d'essai (QZZCWAT).
2. Régler le régulateur de tension dans le moteur (voir Fig. 3), de telle sorte que la sortie soit en deçà de la valeur standard.

Valeur standard: 3000 + 15, -10Hz

Fig. 3

Reglage de L'amplification de Lecture

1. Faire jouer la partie réglée de l'amplification (315 Hz, 0 dB) de la bande d'essai (QZZCFM).
2. Régler VR1 (canal de gauche) et VR2 (canal de droite) de telle sorte que la sortie soit en deçà de la valeur standard.

Valeur standard: 0.4V ± 0.5dB

Fig. 4

Reponse en Frequence de la Lecture

1. Faire jouer la partie de la réponse en fréquence (315 Hz, 12.5 kHz, -63 Hz, -20 dB) de la bande d'essai (QZZCFM).
2. S'assurer que la réponse en fréquence soit en deçà de la plage montrée dans la Fig. 6, à la fois pour le canal de gauche et le canal de droite.

Fig. 5

Fig. 6

Reglage du Mesureur Fluorescent

1. Introduire la bande d'essai vierge normale (QZZCRA) et appliquer un signal d'entrée de référence (1 kHz, -24 dB) sur le mode d'intermission d'un disque.
2. En utilisant un atténuateur, le régler jusqu'à ce que la tension des bornes "LINE OUT" (sortie de ligne) des platines de magnétophones soit de 0.4 V.

Reglage de -40 dB

3. Diminuer le niveau du signal d'entrée de l'étape 1 de 40 dB et l'appliquer à l'appareil.
4. Régler VR61 de telle sorte que le segment de "-40 dB" soit légèrement éclairé.

Reglage de 0 dB

5. Régler le niveau du signal d'entrée comme il est indiqué à l'étape 2 ci-dessus.
6. Ajuster VR62 de telle sorte que le segment "0 dB" soit légèrement éclairé.
7. Répéter les étapes 1 ~ 6 ci-dessus et s'assurer que les segments à la fois de -40 dB et de 0 dB s'éclairent légèrement.

Fig. 7

Reponse en Frequence Totale

1. Introduire la bande d'essai vierge normale (QZZCRA) et régler l'appareil sur le mode d'intermission d'un disque.
2. Appliquer un signal d'entrée de référence (1 kHz, -24 dB) par l'intermédiaire d'un atténuateur.
3. Diminuer le signal de 20 dB et régler la fréquence de 50 Hz ~ 15 kHz.
4. Enregistrer le balayage de fréquence.
5. Faire jouer le signal enregistré et s'assurer qu'il soit en deçà de la plage montrée à la Fig. 9 en comparaison à la fréquence de référence (1 kHz).
6. S'il n'est pas en deçà de la plage standard, régler VR301 (canal de gauche) et VR302 (canal de droite) de telle sorte que le niveau de fréquence soit en deçà de la plage standard.
 - Elévation du niveau dans la plage de fréquence élevée..... Augmente le courant de polarisation.
 - Diminution du niveau dans la plage de fréquence élevée..... Diminue le courant de polarisation.
7. Répéter les étapes 2 ~ 6 ci-dessus en utilisant la bande CrO₂ (QZZCRX) et la bande métallisée (QZZCRX) en augmentant la plage de fréquence à 16 kHz (50 Hz ~ 16 kHz).
8. S'assurer que le niveau soit en deçà de la plage montrée à la Fig. 10.

Fig. 8

Fig. 9

Fig. 10

Reglage de L'amplification Totale

1. Introduire la bande d'essai vierge normale (QZZCRA) et régler l'appareil sur le mode d'intermission d'un disque.
2. Appliquer un signal d'entrée de référence (1 kHz, -24 dB). Diminuer la sortie de telle sorte que son niveau devienne de 0.4 V.
3. Enregistrer ce signal d'entrée.
4. Faire jouer le signal enregistré à l'étape 3 ci-dessus, et s'assurer que la sortie en deçà de la valeur standard.
5. Si elle n'est pas en deçà de la valeur standard, régler VR151 (canal de gauche) et VR152 (canal de droite).
6. Répéter les étapes 2 ~ 5 ci-dessus jusqu'à ce que la sortie soit en deçà de la valeur standard.

Valeur standard: 0.4V ± 0.5dB

Fig. 11

Reglage de HX-PRO

1. Introduire la bande vierge métallisée (QZZCRZ) et régler l'appareil sur le mode d'intermission d'un disque.
2. Raccorder un voltmètre à C.C. à travers R325 (canal de gauche, 10 ohms) et R326 (canal de droite, 10 ohms).
3. Régler L303 (canal de gauche) et L304 (canal de droite) de telle sorte que la tension soit inférieure à 110 mV C.C.

Fig. 12

TPA { TP305 (L-CH) TP306 (R-CH) TPB { R325 (L-CH) R326 (R-CH)

Reglage de la Synchronisation de dbx

Cote du Codage

1. Régler le commutateur de réduction des bruits sur la position "dbx".
2. Appliquer un signal de 1 kHz aux bornes "LINE IN" (entrée de ligne) par l'intermédiaire d'un atténuateur.
3. Brancher un voltmètre à C.A. à travers R565 (canal de gauche) et R566 (canal de droite). Ajuster le niveau du signal d'entrée de telle sorte que la tension soit de 20 mV.
4. Brancher un voltmètre à C.C. à travers R550 (TP551) et ajuster VR551 de telle sorte que la tension soit de 15 mV.

Cote du Decodage

5. Répéter les étapes 1 et 2 ci-dessus.
6. Brancher un voltmètre à C.A. à travers R515 (canal de gauche) et R516 (canal de droite). Ajuster le niveau du signal d'entrée de telle sorte que la tension soit de 20 mV.
7. Brancher un voltmètre à C.C. à travers R500 (TP501) et ajuster VR501 de telle sorte que la tension devienne de 15 mV.

Fig. 13

TPA { TP551 (ENCODE) TP501 (DECODE) TPB { R550 (ENCODE) R500 (DECODE)

Reglage de L'amplification de dbx

1. Introduire la bande d'essai vierge normale (QZZCRA) et régler l'appareil sur le mode d'enregistrement.
2. Appliquer un signal de 1 kHz à "LINE IN" (entrée de ligne) par l'intermédiaire d'un atténuateur.
3. Ajuster le niveau d'entrée de telle sorte que la lecture du mesureur soit de 0 dB.
4. Brancher un voltmètre à C.A. à la borne "LINE OUT" (sortie de ligne).
5. Commuter la position du commutateur de contrôle entre "TAPE" et "SOURCE". Ajuster VR553 (canal de gauche) et VR554 (canal de droite) de telle sorte que la différence de tension à "LINE OUT" (sortie de ligne) soit en deçà de 0.5 dB.

Fig. 14

ESPAÑOL

Sírvase utilizarse junto con manual de servicio para el model No. RS-B905

MÉTODOS DE AJUSTE Y MEDIDA

Instrumento de medición

- EVM(Voltímetro electrónico)
- Osciloscopio
- Frecuencímetro digital
- Oscilador AF
- ATT(Atenuador)
- Voltímetro CC
- Resistor(600Ω)

Ajuste Azimutal de Cabeza

- 1.Reproducir la porción de ajuste azimutal (8 kHz, -20 dB) de la cinta de prueba (QZZCFM). Variar el tornillo de ajuste azimutal hasta que las salidas del CH-I y CH-D se maximicen y la forma de onda de lissajous, como ilustrado, se acerque a grado 0.

Nota:

Si CH-I y CH-D no son maximizados en el mismo punto, ajustar al punto donde los niveles de cada canal sean maximizados e igualados.

- 2.Efectuar el mismo ajuste en la modalidad de reproducción.

Fig. 1

Fig. 2

Ajuste de Velocidad de Cinta

- 1.Reproducir la porción de la cinta prueba (QZZCWAT).
- 2.Ajustar el VR en el motor (ver la Fig. 3) de manera que salida esté dentro del valor estándar.

Valor estándar: 3000 ± 15, -10Hz

Fig. 3

Ajuste de Ganancia de Reproducción

- 1.Reproducir la porción ajustada de ganancia (315 Hz, 0 dB) de la cinta de prueba (QZZCFM).
- 2.Ajustar VR1 (CH-I) y VR2 (CH-D) de manera que la salida esté dentro del valor estándar.

Valor estándar: 0.4V ± 0.5dB

Fig. 4

Respuesta de Frecuencia de Reproducción

- 1.Reproducir la parte de respuesta de frecuencia de reproducción (315 Hz, 12.5 kHz ~ 63 Hz, -20 dB) de la cinta de prueba (QZZCFM).
- 2.Asegurarse de que la respuesta de frecuencia esté dentro de la gama mostrada en la Fig. 6 para ambos CH-I y CH-D.

Fig. 5

Fig. 6

Ajuste de Medidor de Fluorescente

- 1.Insertar la cinta de prueba en blanco normal (QZZCRA) y aplicar una señal de entrada de referencia (1 kHz, -24 dB) en la modalidad de Pausa de Grabación.
- 2.Utilizando un atenuador, ajustarlo hasta que la tensión de los terminales "LINE OUT" (salida de línea) de las platinas de cinta sea 0.4 V

Ajuste de -40 dB

- 3.Atenuar el nivel de entrada de señal en paso 1, por 40 dB y aplicarlo a la unidad.
- 4.Ajustar VR61 de manera que el segmento "-40 dB" esté ligeramente iluminado.

Ajuste de 0 dB

- 5.Poner el nivel de señal de entrada como indicado en el paso 2 de arriba.
- 6.Ajustar VR62 de manera que el segmento "0 dB" esté ligeramente iluminado.
- 7.Repetir los pasos 1 ~ 6 de arriba y asegurarse de que ambos segmentos, -40 dB y 0 dB, se iluminen ligeramente.

Fig. 7

Respuesta de Frecuencia Total

- 1.Poner una cinta virgen normal (QZZCRA) y poner la unidad en la modalidad de Pausa de Grabación.
- 2.Aplicar la señal de entrada de referencia (1 kHz, -24 dB) a través de un atenuador.
- 3.Atenuar la señal por 20 dB y ajustar la frecuencia de 50 Hz ~ 15 kHz.
- 4.Grabar el barrido de frecuencia.
- 5.Reproducir la señal grabada y asegurarse de que esté dentro de la gama mostrada en la Fig. 9 en comparación con la frecuencia de referencia (1 kHz).
- 6.Si no está dentro de la gama de frecuencia, ajustar VR301 (CH-I) y VR302 (CH-D) de manera que el nivel de frecuencia esté dentro de la gama estándar.
 - Subir el nivel en la gama de frecuencia alta..... Incrementar la corriente de polarización.
 - Bajar el nivel en la gama de frecuencia baja..... Disminuir la corriente de polarización.
- 7.Repetir los pasos 2 ~ 6 de arriba utilizando la cinta Cro2 (QZZCRX) y la cinta metálica (QZZCRZ) incrementando la gama de frecuencia a 16 kHz (50 Hz ~ 16 kHz).
- 8.Asegurarse de que el nivel esté dentro de la gama mostrada en la Fig. 10.

Fig. 8

Fig. 9

Fig. 10

Ajuste de Ganancia Total

1. Insertar la cinta de prueba en blanco normal (QZZCRA) y poner la unidad en modalidad de pausa de Grabación.
2. Aplicar la señal de entrada de referencia (1 kHz, -24 dB). Atenuar la salida de manera que su nivel se haga 0.4 V.
3. Grabar la señal de entrada.
4. Reproducir la señal grabada en el paso 3 de arriba y asegurarse de que la salida esté dentro del valor estándar.
5. Si no está dentro del valor estándar, ajustar **VR151** (CH-I) y **VR152** (CH-D).
6. Repetir el paso 2 ~ 5 de arriba hasta que la salida esté dentro del valor estándar.

Valor estándar: $0.4V \pm 0.5dB$

Fig. 11

Ajuste de HX-PRO

1. Insertar la cinta en blanco metálica (QZZCRZ) y poner la unidad en la modalidad de pausa de Grabación.
2. Conectar un voltímetro CC través de **R325** (CH-I, 10 ohmios) y **R326** (CH-D, 10 ohmios).
3. Ajustar **L303** (CH-I) y **L304** (CH-D) de manera que la tensión se haga menos de 110 mV CC.

Fig. 12

TPA { TP305 (L-CH)
TP306 (R-CH) } TPB { R325 (L-CH)
R326 (R-CH) }

Ajuste de Sincronización de dbx

Lado de Codificar

1. Poner el interruptor de reducción de ruido en la posición dbx.
2. Aplicar una señal de 1 kHz a los terminales "LINE IN" (entrada de línea) a través de un atenuador.
3. Conectar un voltímetro CC a través de **R565** (CH-I) y **R566** (CH-D). Ajustar el nivel de señal de entrada de manera que la tensión se haga 20 mV.
4. Conectar un voltímetro CC a través de **R550** (TP551) y ajustar **VR551** de manera que la tensión se haga 15 mV.

Lado de Descodificador

5. Repetir los pasos 1 y 2 de arriba.
6. Conectar un voltímetro CC a través de **R515** (CH-I) y **R516** (CH-D). Ajustar el nivel de señal de entrada de manera que la tensión sea 20 mV.
7. Conectar un voltímetro CC a través de **R500** (TP501) y ajustar **VR501** de manera que la tensión se haga 15 mV.

Fig. 13

TPA { TP551 (ENCODE)
TP501 (DECODE) }

TPB { R550 (ENCODE)
R500 (DECODE) }

Ajuste de Ganancia de dbx

1. Insertar la cinta de prueba en blanco normal (QZZCRA) y poner la unidad en la modalidad de Grabación.
2. Aplicar una señal de 1 kHz a la "LINE IN" (entrada de línea) a través de un atenuador.
3. Ajustar el nivel de entrada de que la lectura del medidor sea 0 dB.
4. Conectar un voltímetro CC al terminal de "LINE OUT".
5. Conmutar la posición del interruptor de monitor entre "TAPE" (cinta) y "SOURCE" (fuente). Ajustar **VR553** (CH-I) y **VR554** (CH-D) de manera que la diferencia de tensión en "LINE OUT" esté dentro de 0.5 dB.
