NEW MECHANISM FOR RS-DC10 (AR350D)

SPECIFICATIONS

■ Digital Recording/Playback

Tape recording system: Stationary head type DCC
 Sampling frequencies
 (Analog input recording): 44.1 kHz
 (Playback/digital input recording):
 48 kHz, 44.1 kHz, 32 kHz
 (selected automatically)
 No. of quantizing bits: 16-bit linear
 Audio coding system: PASC
 No. of channels: 2-channel (stereo)
 Frequency response: 10 Hz–20,000 Hz (± 0.2 dB)
 (48 kHz sampling frequency):
 10 Hz–22,000 Hz (± 0.2 dB)
 (32 kHz sampling frequency):
 10 Hz–14,500 Hz (± 0.2 dB)
 THD
 (Playback): 0.003% or less (1 kHz, 0 dB)
 (Recording/playback): 0.005% or less (1 kHz, 0 dB)
 Dynamic range
 (Playback): 95 dB or more (A-weighted)
 (Recording/playback): 92 dB or more (A-weighted)
 S/N ratio
 (Playback): 98 dB or more (A-weighted)
 (Recording/playback): 92 dB or more (A-weighted)
 Channel separation
 (Playback): 95 dB or more (1 kHz)
 (Recording/playback): 80 dB or more (1 kHz)
 Wow and flutter: Below measurable limit

■ Analog Cassette Tape Playback

Deck system: Analog compact cassette
 Track system: 4-track, 2-channel (stereo)
 Frequency response (Dolby NR off)
 Normal: 30 Hz–15,000 Hz ± 3 dB
 CrO₂: 30 Hz–16,000 Hz ± 3 dB
 Metal: 30 Hz–17,000 Hz ± 3 dB
 S/N (signal level=250 nwb/m, CrO₂ type tape)
 NR off: 56 dB (A-weighted)
 Dolby B NR on: 65 dB (CCIR)
 Dolby C NR on: 74 dB (CCIR)
 Wow and flutter: 0.07% (WRMS)
 $\pm 0.2\%$ (DIN)

■ Terminals

Analog input
 Input sensitivity: 60 mV (-12 dB)
 Input impedance: 47 k Ω
 Analog output (Fixed)
 Output level: 500 mV (DCC: -1.2 dB)
 Maximum output level: 2 V (DCC: 0 dB)
 Output impedance: 440 Ω
 Variable analog
 Output: Using remote control
 Headphones output
 Maximum level: 30 mW+30 mW (32 Ω load)
 Load impedance range: 8–600 Ω
 Digital input: Coaxial 75 Ω /optical
 (with select SV)
 Digital output: Coaxial 75 Ω /optical
 (parallel output)

Technics

■ Mechanism

Heads:	20-channel thin film head
Tape drive system:	Single capstan drive (Auto reverse)
Tape drive motors	
Capstan:	DC servo motor
Reel table:	DC motor
Tape speed:	4.76cm/sec. (1-7/8 ips.)
Fast forward and rewind times:	Approx. 100sec. with D-60 cassette tape

■ General

Power consumption:	35W
Power supply:	
For (EG) area:	AC 50/60Hz, 230V
For (EB) area:	AC 50/60Hz, 240V
For (G) area:	AC 50/60Hz, 110V, 120V, 240V, 220V
Dimensions (W × H × D):	430 × 153 × 341 mm
Weight:	8.3kg

Note:

Specifications are subject to change without notice.
Weight and dimensions are approximate.

■ ACCESSORIES

- Stereo connection cable
(SFDHM03N02)..... 2 pcs.

- Remote control transmitter
(ZK011D0020)..... 1 pc.

- Batteries..... 2 pcs.
for remote control transmitter
*〈UM-4, "AAA" (R03)〉

- DCC tape..... 1 pc.
for recording purposes
*(RT-D60E)

- Power plug adaptor
(YJ04001280)
for (G) area only

* These are available on sale route.

■ MAIN FEATURES OF DCC

1. Compatibility with Conventional Analog Format

■ Backward Compatibility

Since every DCC machine can also play analog compact cassettes, DCC is sure to be acceptable to most users. This backward compatibility is particularly attractive in car audio and headphone stereo applications. It saves space since only one machine is needed to play cassettes in either format. There's no need to carry or install separate players for analog and digital.

To provide this compatibility, all DCC machines have bi-directional auto reverse operation, using a unique half digital, half analog head configuration.

■ Mechanical Simplicity

DCC machines use a stationary head configuration, rather than the helical scan rotating head system required for DAT (and VCRs). Except for the head itself, analog tape transports can, for the most part, be used for DCC.

■ Plentiful Musicassettes

DCC has enlisted the support of the world's major record companies. Working with the Philips team, some of them even participated in DCC development.

Whereas there were only a small number of disc titles when the CD first came out, an extremely wide variety and large number of prerecorded titles will be available on DCC from the very first day the format is launched.

In addition, existing 32-times and 64-times high speed tape duplication equipment requires only slight modification to handle dubbing of DCC tapes, so manufacturing costs of prerecorded DCC cassettes promise not to be significantly higher than those of analog prerecorded cassettes.

2. Latest in Digital Technology

■ PASC — Newly Developed Intelligent Coding System

Without PASC, the DCC format could not use a linear-tracking stationary head and ordinary coercivity tape, and therefore would not achieve playback compatibility with analog cassettes. PASC effectively reduces the amount of information that needs to be stored, thereby lessening the storage density requirements of the media and the bit-rate requirements during write/read (recording/playback) operations. You could say that PASC lightens the work load of the transducers (heads) and media (tape) by taking an "intelligent" approach to the coding process.

To understand this difference, let's take a look at linear PCM coding first. Despite the incredible precision and sophistication of linear PCM, it is not designed, nor in fact is it necessary, to consider which data is essential and which is irrelevant. Linear PCM is designed to simply encode all the data presented to it. The result of linear PCM is an output waveform that is physically identical to the input waveform (after anti-aliasing low-pass filtering). All of the measurable information contained in the original input waveform is retained in the reproduced output waveform.

PASC, in contrast, analyzes the input waveform to determine which portions are really needed. Such an approach may appear heretical to audio purists, but it is in fact the basis of many already widely accepted technologies.

PASC — High Efficiency Intelligent Coding

Fig. 1

As shown here PASC simply applies proven psychoacoustic principles, such as the masking effect and hearing threshold, to economize on data. Therefore, instead of reproducing what the original waveform looks like, PASC reproduces what the original waveform sounds like.

Since this is, to a large extent, a value judgment, audio engineers from a major record company were involved in the fine-tuning of PASC to assure the system offered outstanding "musicality."

DCC Player/Recorder Block Diagram

PASC Encoding Process

Fig. 3

PASC Decoding Process

Fig. 4

THIN-FILM HEAD AND TRACK DISTRIBUTION

1. Eight Digital Tracks plus One Auxiliary Track

DCC tape is divided into an upper sector (forward) and lower sector (reverse), physically corresponding to side B (reverse) and side A (forward) of an analog tape. Each sector comprises eight tracks for digital audio data and one track for auxiliary data.

Recording lays down tracks 185 microns wide, whereas playback looks at only a 70 micron portion of this width. This means that transport accuracy becomes less critical, the possibility of mistracking is virtually eliminated, and manufacturers can largely use existing analog cassette transport components.

Digital Track Distribution

Fig. 5

DCC Thin-Film Head Structure

Fig. 6

2. Stationary Thin-Film Head

Along with PASC, this was another key to the development of DCC equipment. To handle its narrow track pitch of 195 microns, DCC uses a precision head fabricated by thin-film technology (related to the lithographic process employed in LSI manufacturing).

For recording, new digital data is simply overwritten so no separate erase facility is provided. For bi-directional operation, head configurations will be: a) turnover type digital 9-track head (upper) and analog 2-track head (lower), or b) fixed-type twin head.

■ CONNECTIONS

Be sure to turn off the power to all the components before proceeding to connect them.
Connect the power cable only after all the other connections have been performed.

An example of the connections is given below.
For further details, consult the Operating Instructions of the components involved as well.

Digital connections

There are two ways to perform the digital connections: either connect a digital amplifier to the deck or connect another digital component directly to the deck.

Digital direct recording

A CD player or other digital component can be connected directly to the deck and the digital signals of that component can be recorded without further ado. (See "SCMS" on pages 11 and 12.)

About Optical Fiber Cables

To connect optical fiber cables

- ① Remove the dust cap from the terminal.
- ② Connect the cable.

Dust cap

Align the terminal shape.

Do not attempt to bend optical fiber cables at severe angles.

Be sure that connections are made securely.

Store the dust cap securely, and replace it whenever cables are not connected to the terminals. If dust is allowed to enter the terminal connector, signal errors may result.

About OPTICAL connector

When the optical connectors are used, electrical signals are converted into light signals for transmission between units, making the signals impervious to adverse effects from external noise. This form of connection thus allows the highest quality of digital audio signal transmission.

■ CAUTION FOR AC MAINS LEAD

FOR (EB) area only

For your safety, please read the following text carefully.

This appliance is supplied with a moulded three pin mains plug for your safety and convenience.
A 5-ampere fuse is fitted in this plug.
Should the fuse need to be replaced please ensure that the replacement fuse has a rating of 5-ampere and that it is approved by ASTA or BSI to BS1362.
Check for the ASTA mark  or the BSI mark  on the body of the fuse.

If the plug contains a removable fuse cover you must ensure that it is refitted when the fuse is replaced.
If you lose the fuse cover the plug must not be used until a replacement cover is obtained.
A replacement fuse cover can be purchased from your local dealer.

CAUTION!

IF THE FITTED MOULDED PLUG IS UNSUITABLE FOR THE SOCKET OUTLET IN YOUR HOME THEN THE FUSE SHOULD BE REMOVED AND THE PLUG CUT OFF AND DISPOSED OF SAFELY.
THERE IS A DANGER OF SEVERE ELECTRICAL SHOCK IF THE CUT OFF PLUG IS INSERTED INTO ANY 13-AMPERE SOCKET.

If a new plug is to be fitted please observe the wiring code as shown below.
If in any doubt please consult a qualified electrician.

IMPORTANT

The wires in this mains lead are coloured in accordance with the following code:

Blue: Neutral

Brown: Live

As the colours of the wires in the mains lead of this appliance may not correspond with the coloured markings identifying the terminals in your plug, proceed as follows:

The wire which is coloured BLUE must be connected to the terminal in the plug which is marked with the letter N or coloured BLACK.

The wire which is coloured BROWN must be connected to the terminal in the plug which is marked with the letter L or coloured RED.

Under no circumstances should either of these wires be connected to the earth terminal of the three pin plug marked with the letter E or the Earth Symbol .

Before use

Remove the connector cover as follows.

How to replace the fuse

1. Remove the fuse cover with a screwdriver.

2. Replace the fuse and attach the fuse cover.

FOR (G) area only

Be sure to disconnect the mains cord before adjusting the voltage selector.
Use a minus (–) screwdriver to set the voltage selector (on the rear panel) to the voltage setting for the area in which the unit will be used.

(If the power supply in your area is 117 V or 120 V, set to the "127 V" position.)

Note that this unit will be seriously damaged if this setting is not made correctly. (There is no voltage selector for some countries; the correct voltage is already set.)

SUGGESTIONS FOR SAFETY

Use a standard AC wall outlet

1. Use from an AC power source of high voltage, such as that used for an air conditioner, is very dangerous.

A fire might be caused by such a connection.

2. A DC power source cannot be used.

Be sure to check the power source carefully, especially on a ship or other place where DC is used.

Grasp the plug when disconnecting the power supply cord

1. Wet hands are dangerous.

A dangerous electric shock may result if the plug is touched by wet hands.

2. Never place heavy items on top of the power supply cord, nor force it to bend sharply.

Place the unit where it will be well ventilated

Place this unit at least 10 cm (4") away from wall surfaces, etc.

Be careful that curtains and similar materials do not obstruct the ventilation holes.

Avoid places such as the following: In direct sunlight or in other places where the temperature is high.

In places where there is excessive vibration or humidity.

Such conditions might damage the cabinet and/or other component parts and thereby shorten the unit's service life.

Be sure to place the unit on a flat, level surface.

If the surface is inclined, a malfunction may result.

If the power plug will not fit your Household AC outlet, use the power plug adaptor (included).

Never attempt to repair nor reconstruct this unit

A serious electric shock might occur if this unit is repaired, disassembled or reconstructed by unauthorized persons, or if the internal parts are accidentally touched.

Take particular care if children are present

Never permit children to put anything, especially metal, inside this unit. A serious electric shock or malfunction could occur if articles such as coins, needles, screwdrivers, etc. are inserted through the ventilation holes, etc. of this unit.

If water is spilled on the unit

Be extremely careful if water is spilled on the unit, because a fire or serious electric shock might occur. Immediately disconnect the power cord plug, and consult with your dealer.

Avoid spray-type insecticides

Insecticides might cause cracks or "cloudiness" in the cabinet and plastic parts of this unit. The gas used in such sprays might, moreover, be ignited suddenly.

Never use alcohol or paint thinner

These and similar chemicals should never be used, because they might cause flaking or cloudiness of the cabinet finish.

Disconnect the power supply cord if the unit will not be used for a long time

If the unit is left for a long time with the power ON, this not only will shorten its useful operation life, but also may cause other trouble.

If trouble occurs

If, during operation, the sound is interrupted or indicators no longer illuminate, or if an abnormal odour or smoke is detected, immediately disconnect the power cord plug, and contact with your dealer or an Authorized Service Center.

LOCATION OF CONTROLS

Control section

- 1 Power switch (POWER)

- 2 Timer switch (TIMER)

Use this when a timer from an audio store has been connected to start playback or recording at a particular time.

- 3 Marker control section

AUTO START MKR:

For setting the start marker's writing mode to automatic or manual.

START MKR WRITE:

For writing the start marker manually.

RENUMBER:

For renumbering the track sequence when correcting the track numbers.

NEXT MKR WRITE:

For writing the next marker which automatically activates playback from the start of the reverse side.

REVERSE MKR WRITE:

For writing the reverse marker which automatically reverses the tape side from A to B.

MKR ERASE:

For erasing written markers.

- 4 Dolby NR selector (DOLBY NR)

This can be set to Dolby B, C or OFF, depending on which Dolby position, if any, was used for the recording on the analog cassette tape which is to be played back.

- 5 Counter reset button (COUNTER RESET)

Use this to return the tape counter to "0000".

- 6 Repeat mode selector button (REPEAT)

Use this to switch to the repeat play mode.

- 7 Display section

(See page 7 for details.)

- 8 Cassette tray

- 9 Text information selector button (TEXT)

Use this to select what is to be displayed—the title of the track now being played, etc.

- 10 Counter selector button (COUNTER)

Use this to select the tape counter's display mode.

- 11 Cassette tray open/close button (OPEN/CLOSE)

Use this to open or close the cassette tray.

- 12 Input selector (INPUT SELECTOR)

Use this to select the analog (ANALOG)/digital input (COAXIAL/OPTICAL).

- 13 Recording level control (REC LEVEL)

Use this to adjust the recording level when analog input signals are being recorded.

- 14 Balance control (BALANCE)

Use this to adjust the balance between the left and right channels when analog input signals are being recorded.

- 15 Remote control sensor (REMOTE SENSOR)

- 16 Tape travel selector button (SIDE A/B)

Use this to select the direction in which the tape is to travel.

- 17 Skip buttons (SKIP ◀◀ / ▶▶)

Use these to skip to the track you want to hear.

- 18 Basic control section

Rewind button (REW ◀◀)

Stop button (STOP ■)

Play button and indicator (PLAY ▶)

Fast forward button (FF ▶▶)

- 19 Pause button (PAUSE II)

- 20 Append recording button (APPEND ▶▶)

Use this to search for the end of the recorded section on the tape where more material is to be appended, and set the deck to the recording standby mode.

- 21 Record button and indicator (REC ●)

- 22 Recording mute button (AUTO REC MUTE ○)

Use this to create unrecorded blanks between tracks on the tape.

- 23 Headphones jack (PHONES)

- 24 Headphone volume control (PHONES LEVEL)

Display section

1 Tape travel direction indicators

(◀ B / A ▶)

These indicators show the direction in which the tape is traveling.

(The B / A display appears only when a DCC tape is used.)

2 Reverse mode indicator

This indicates the reverse mode.

(For analog cassette tapes only)

3 Dolby NR indicators (DOLBY B C)

These indicate the type of Dolby noise reduction which has been selected. When both of these indicators are off, it means that neither type of Dolby noise reduction has been selected.

4 Repeat mode indicators (CONT REPEAT/REPEAT TRACK)

CONT REPEAT:

All tracks are repeated.

REPEAT TRACK:

The track being played is repeated.

(For DCC tapes only)

5 Level meters

These indicate the input levels during recording and the levels recorded on the tape during playback.

When a DCC tape is used, the values at the top are displayed; when an analog cassette is used, the values at the bottom are displayed.

6 Text information/counter display section

When a prerecorded DCC music tape is played back, text information relating to what is being played appears on the display.

Track number display (TRACK):

This indicates the number of the track which is being played back or recorded.

Timer/counter display (TIME/COUNTER):

This indicates how many minutes and seconds of the track which is being played back or recorded have elapsed or it shows the tape counter display.

Mode display (MODE):

This indicates the operating mode which is currently established.

7 Marker indicator section

Start marker automatic indicator (AUTO):

This lights when the start marker is set to the automatic writing mode.

Start marker indicator (START):

This lights when the start marker has been written manually or when the start marker position is reached.

Reverse marker indicator (REVERSE):

This lights when the reverse marker has been written or when the reverse marker position is reached.

Marker indicator (MARKER):

This lights when any of the marker positions is reached.

Marker write indicator (WRITE):

This lights while a marker is being written.

Marker erase indicator (ERASE):

This lights while a marker is being erased.

8 DCC indicator (DCC)

This lights only when a DCC tape is being used.

9 Counter display indicators

(ABS, REM, TOTAL, TRACK)

The indicator corresponding to the setting of the COUNTER selector button is selected as follows.

ABS : Absolute time display

REM : Time remaining on one side of the tape

REM TOTAL : Total time remaining on the tape

TRACK : Elapsed time of track now being played.

10 Sampling frequency indicators

(48kHz, 44kHz, 32kHz)

These indicate the sampling frequency during the playback or recording of digital signals.

(For DCC tapes only)

11 Input indicator section

The indicators listed below light up when the INPUT selector has been set to the corresponding positions.

Optical input indicator (OPTICAL)

Coaxial input indicator (COAXIAL)

Analog input indicator (ANALOG)

12 Digital copy prohibit indicator (COPY PROHIBIT)

This lights when a copy prohibit signal is included among the source signals when digital input signals are supplied.

■ ABOUT DCC TAPE

Types of tapes which can be used

The types of tapes described below can be used with this deck.

Digital compact cassette tapes (DCC)

There are two types of DCC tapes.

1. Prerecorded DCC music tapes available in stores:
For playback only
2. DCC tapes for recording

Conventional analog cassette tapes: For playback only (Analog compact cassette tapes)

DCC tapes for recording

Unlike analog cassette tapes, DCC tapes are completely sealed, and their tape and hub holes are protected by a slider.

This design ensures that, except when the cassette is loaded, dust and foreign particles will not enter the cassette housing and cause dropouts (digital signal losses) which are the main cause of deterioration in the quality of digital recordings.

DCC tapes for recording come in lengths of 45, 60 and 90 minutes.

Tampering with the cassette tape length identification holes in any way can cause malfunctioning.

Safeguarding against the accidental erasure of a valuable recording

Recorded tapes that you want to keep can be protected by sliding the accidental erasure prevention tab on the rear side of the cassette to the "up" position shown in the diagram. It will then be impossible to record on the tape, thus protecting important recordings from accidental erasure.

To re-record

Return the accidental erasure prevention tab to its indented (open) position.

Handling precautions

Do not open the cassette's slider to pull the tape out or touch it.

Take care not to drop the cassette, hit it or subject it to strong vibration.

The cassette cannot be turned over and used.

Storage precautions

Replace the cassette in its case and store away. Do not place or store tapes in the following places:

1. Where it is very hot (over 35°C) or very humid (over 80%)
2. Where there are strong magnetic fields (near speakers or on top of a TV set, etc.)
3. Where the tapes will be exposed to direct sunlight

■ SCMS (SERIAL-COPY-MANAGEMENT-SYSTEM)

This unit is equipped with SCMS (Serial Copy Management System). SCMS is a system which allows digital-signal copying of CDs and commercial music DCC tapes only for one "generation". The DCC tape thus recorded cannot be used as a master tape

to produce further generations (serial copies) of the first digital copy. The accompanying illustrations describe the ways in which recording is possible from each kind of source.

1 DCC tapes recorded digitally from CDs

Digital-signal recording from a CD can be performed only for the first generation of DCC tape. The DCC tape thus recorded (1st generation) cannot be used as a master to make further digital copies (serial copies).

Digital signals from a CD player recorded on a DAT cannot be recorded in their original form from the DAT tape onto a digital compact cassette tape in their original form. Similarly, digital signals from a CD player recorded onto a DCC in their original form cannot be recorded from the DCC tape onto a digital audio tape in their original form. In other words, SCMS restricts the recording of digital signals even when different digital recording equipment such as DAT and DCC are used in combination.

2 DCC tapes recorded digitally from a commercially produced music DCC tape or DAT cassette

Digital-signal recording from a commercially produced DCC or DAT music tape can be performed only for the first generation of DCC tape. The DCC tape thus recorded (1st generation) cannot be used as a master to make further digital copies (serial copies).

However, it should be noted that it may not be possible to make digital copies from commercial DCC or DAT music tapes which do not conform to the SCMS format.

3 DCC tape recorded from analog input terminals (when thereafter recorded digitally)

When the DCC recording of an analog source is used as the master tape for further digital-signal DCC copies, up to two generations of digital copies can be made. However, the second generation of such

copies cannot be used as the master tape for making third and subsequent generations of digital copies (serial copies).

4 DCC tapes recorded from analog input terminals (when recorded in analog thereafter)

When recording is performed from the analog input terminals, no restrictions are made on copies, in the same way as for conventional audio cassette tape recorders. Accordingly, even in cases where

recording of the digital signal (digital copy) is not possible, the analog input and output terminals can be used to perform analog recording.

Digital copy prohibit display

In the following cases, digital signals cannot be recorded in their original form:
When recording signals from a source which has been digitally copied once before

The COPY PROHIBIT indicator lights.

COPY
PROHIBIT

When a copy prohibit signal is supplied during recording

SCMS STOP

When a copy prohibit signal is supplied in the recording standby mode

SCMS

HANDLING PRECAUTIONS FOR DCC HEAD

Because static electricity or magnetism can damage the DCC head, please observe the following when handling the DCC head.

1) Caution on magnetism

Be sure to use only the designated screwdriver (RFKZ0037) when making aztec adjustment.

Never use a steel screwdriver or other screwdriver whose blade or tip is magnetized.
Keep the DCC head away from all magnetized objects.

2) Caution on static electricity

Be sure to insert a shorting clip in the terminal of the FPC board (DCC head).

Connect the FPC board to the PCB connector as quickly as possible.

3) Others

Be especially careful not to use force when manipulating the FPC board or it will break or disconnect.

• Grounding for electrostatic breakdown prevention

1. Human body grounding

Use the anti-static wrist strap to discharge the static electricity from your body.

2. Work table grounding

Put a conductive material (sheet) or steel sheet on the area where the DCC head is placed, and ground the sheet.

Note:

It is important to ground the instrument before testing. Use either the ground contact of a nearby 3P wall outlet, or connect it to the frame ground of an instrument which is connected a 3P wall outlet.

Caution:

The static electricity of your clothes will not be grounded through the wrist strap. So, take care not to let your clothes touch the DCC head.

HEAD CLEANING METHOD

Clean the head up and down with a cotton swab slightly moistened with alcohol.

DISASSEMBLY INSTRUCTIONS

"ATTENTION SERVICER"

Some chassis components may have sharp edges. Be careful when disassembling and servicing.

Ref.No. 1	Removal of the top cover ass'y	Ref.No. 2	Removal of the P.C.B. cover
Procedure 1	 1. Remove the 7 screws (①~⑦). 2. Remove the top cover ass'y in the direction of arrow.	Procedure 1→2	 • Remove the 2 screws (①, ②).
Ref.No. 3	Removal of the front panel ass'y	 3. Remove the 2 claws. 4. Remove the front panel ass'y in the direction of arrow.	
Procedure 1→2→3	 1. Remove the 5 connectors (JU02, JH04, JH06, J601, J702). 2. Remove the 4 screws (①~④).		
Ref.No. 4	Removal of the rec level/balance P.C.B.	Ref.No. 5	Removal of the headphones level P.C.B.
Procedure 1→2→3→4	 1. Pull out the rec level knob and balance knob. 2. Remove the nut. 3. Remove the 2 screws (①, ②).	Procedure 1→2→3→5	 1. Pull out the headphones level knob. 2. Remove the 2 screws (①, ②). 3. Remove the headphones level P.C.B. in the direction of arrow.

Ref.No.
6

Removal of the operation P.C.B.

Procedure
1 → 2 → 3 → 6

1. Remove the 3 knobs.

2. Remove the 10 screws (① ~ ⑩).
3. Release the 8 claws.

Ref.No.
7

Removal of the loading unit

Procedure
1 → 2 → 3 → 7

1. Remove the 4 screws (① ~ ④).
2. Remove the loading unit in the direction of arrow.

3. Remove the 7 connectors (JM01, JU03, JM04, JM02, JM03, JU01, J408).

Ref.No.
8

Removal of the AD/DA converter P.C.B.

Procedure
1 → 2 → 8

• Remove the AD/DA converter P.C.B. in the direction of arrow.

Ref.No.
9

Removal of the PASC digital P.C.B.

Procedure
1 → 2 → 9

1. Remove the 1 connector (J408).
2. Remove the PASC digital P.C.B. in the direction of arrow.

Ref.No. 10	Removal of the power transformer and voltage selector switch	Ref.No. 11	Removal of the switch rod
Procedure 1 → 10	 1. Remove the 2 connectors(J803,J813). 2. Remove the 6 screws(① ~ ⑥).	Procedure 1 → 2 → 3 → 11	 • Pull the switch rod with twisting the slots of the ends of the switch rod by flat blade screwdriver.
Ref.No. 12	Removal of the power supply P.C.B.	Ref.No. 13	Removal of the main P.C.B.
Procedure 1 → 2 → 3 → 10 → 11 → 12	 1. Remove the 1 screw(①). 2. Remove the 2 connectors(J821,J851).	Procedure 1 → 2 → 3 → 7 → 8 → 9 → 13	 1. Remove the 6 screws(① ~ ⑥).
Ref.No. 14	Removal of the AC cord		
Procedure 1 → 14	 1. Remove the 1 connector(J851). 2. Remove the cord bushing in the direction of arrow ①. 3. Remove the cord bushing in the direction of arrow ②.		
		 2. Remove the 1 connector(J821). 3. Remove the 2 screws(⑦, ⑧). 4. Remove the P.C.B. support.	

Ref.No. 15	Removal of the tray P.C.B.	Ref.No. 16	Removal of the loading motor
Procedure 1 → 2 → 3 → 7 → 15	 1. Remove the 9 connectors(JW01,JW02,JW03,JW04,JW05,JW06,JW12,JW32,JW93). 2. Remove the 2 screws(①,②).	Procedure 1 → 2 → 3 → 7 → 15 → 16	 1. Remove the belt. 2. Remove the 2 screws(①,②).
Ref.No. 17	Removal of the cassette stopper	Ref.No. 18	Removal of the tray ass'y
Procedure 1 → 2 → 3 → 7 → 17	 1. Remove the spring (A) and spring (B). 2. Remove the ribs in the direction of arrow.	Procedure 1 → 2 → 3 → 7 → 17 → 18	 1. Roll the pulley in the direction of arrow ①, and draw out the tray. 2. Remove the tray in the direction of arrow ②.
Ref.No. 19	Removal of the mechanism unit		
Procedure 1 → 2 → 3 → 7 → 17 → 18 → 19	 1. Remove the 1 connector(J101).	 2. Remove the 3 connectors(JW12,JW32,JW93). 3. Remove the 4 screws(①~④). 4. Remove the mechanism unit in the direction of arrow.	

Ref.No. 20	Removal of the Read/Write P.C.B.	Ref.No. 21	Removal of the bottom board
Procedure 1 → 2 → 3 → 7 → 17 → 18 → 20	 1. Remove the 1 connector(J101). 2. Remove the 1 screws(①).	Procedure 1 → 21	 • Remove the 5 screws(①~⑤).

HEAD ASS'Y REPLACEMENT

Cautions:

1. Be sure to wear a grounding wrist band whenever you touch the head assemblies.(RFKZ0036)(See page 13.)
2. When removal the "Head Ass'y" use a unmagnetized adjusting screwdriver.(RFKZ0037)(See page 13.)

DISASSEMBLY INSTRUCTION

1. Release the 2 claws and remove the Pinch roller(L),(R) in the direction of arrow ①.

2. Remove the 2 screws(①, ②).
3. Remove the head ass'y in the direction of arrow ②.

REASSEMBLY INSTRUCTION

1. Align the 4 ribs of head ass'y to the two holes ② and two cutouts in the mechanism chassis.
2. Fix the 2 screws(①, ②) to the head ass'y.

3. Fix the 2 Pinch roller(L),(R) to each boss on the mechanism chassis.
(Press the pinch rollers until it is secured by the claw on the mechanism chassis.)

- ※ • Only remove the shorting clip on the head FPC if the Read/Write P.C.B. connector (J101) is connected.
• After the shorting clip is removed, make connection to the connector (J101) as soon as possible.

■ OPERATIONAL CHECKING PROCEDURE

MECHANISM BLOCK CHECK

(Remount on defective mechanism block. Connect extension cords to pins 9, 10, and 11 and connect extension FPC.)

HOW TO USE "SERVICE MODE"

Test procedure by function of "Service Mode".

This unit provides "Service Mode" function by which the segment test, FL test (*1) and the "ALL ERROR RATE" inspection (*2) can be performed.

Pass/Reject Condition from All Error Rate

Program to play in DCC test tape

Display	Condition	Remedy
"00000000" is constantly displayed for all tracks.	Normal (OK)	—
"01101000" is momentarily displayed for any one to three tracks (or more).	Normal (OK)	—
"11111111" is constantly displayed for one to three tracks (or more).	Error	Clean head with alcohol. (on page 13.) ↓ Check playback signal envelope at J103-pin 7. ↓ Adjust DCC playback level if the envelope amplitude (Vp-p) is too small. ↓ If the envelope amplitude is not at 12Vp-p±100mV, a problem exists in the head or read amplifier. ↓ Check head assembly. ↓ If the head assembly is normal, the read amplifier is most likely at fault.
"11111111" is constantly displayed for all tracks.	Error	
"FFFFFFF" is constantly displayed for all tracks.	Error	Refer to the content of "Read/Write P.C.B. check" on pages 25, 26.

ABOUT THE OPERATIONAL CHECKING POINTS

Capstan Servo Check

A) DCC Playback System

- Connect an oscilloscope to **J411 pin 3** (motor speed TP) on the **PASC digital P.C.B.** as shown in the figure below (connect the scope's ground lead to the chassis ground).
- Load a **DCC music tape (RFKZ0034)** into the unit under test and put the unit in **PLAY mode**. When the capstan servo is locked, a **47 Hz square wave with a duty ratio variation of less than 0.5μs** will be observed on the scope (see Fig. 1). Unlock the servo and verify that the muting function is active.

Fig. 1

Fig. 2

B) DCC Record System and ACC Playback System

- Set up the unit as described in paragraph 1 above.
- Load a **DCC blank tape (RFKZ0033)** into the unit under test and put the unit in **REC mode**. Verify that a continuous **47 Hz square wave with a 50 percent duty ratio** is observed on the scope (see Fig. 3). This is the normal result. Also verify that the same waveform is observed when a prerecorded ACC tape is played.

Fig. 3

Read/Write P.C.B. Check**A) ACC Playback System**

1. Connect an oscilloscope to J103 pin 18 (analog L-channel) or 16 (analog R-channel) on the Read/Write P.C.B. (connect the probe's ground lead to the chassis ground).
2. Play a **prerecorded ACC tape**.
3. Verify that the **waveform changes** as shown below when the unit is switched from **STOP mode to PLAY mode**.

Fig. 4

Fig. 5

Approx. 3 MHz in STOP mode
An AC bias is applied to suppress 600 mVp-p noise inherent to the MR head.

Fig. 6

During playback musical signals are superimposed on the AC bias.

B) DCC Playback System

1. Connect a dual-beam oscilloscope's CH. 1 probe to J103 pin 9 (RD Clock) on the Read/Write P.C.B. (connect the probe's ground lead to the chassis ground).
2. Connect the scope's CH. 2 probe to J103 pin 11 (RD Sync).
3. Play a **DCC music tape (RFKZ0034)**.
4. Verify that the waveform shown below is observed on the scope.

Fig. 7

Fig. 8

5. Connect an oscilloscope's CH. 1 probe to J103 pin 7 (RD Mux) on the Read/Write P.C.B. (connect the probe's ground lead to the chassis ground).
6. Connect the scope's CH. 2 probe to J103 pin 11 (RD Sync).
7. Play a DCC music tape (RFKZ0034).
8. Verify that the waveform shown below is observed on the scope.

Fig. 9

Fig. 10

C) DCC Recording System

9. Connect the dual-beam oscilloscope's CH. 1 probe to J103 pin 5 (WCLK) on the Read/Write P.C.B. (connect the probe's ground lead to the chassis ground).
10. Connect the scope's CH. 2 probe to J103 pin 3 (WDATA).
11. Play a DCC blank tape (RFKZ0033).
Verify that the waveform shown next page is observed on the scope.

Fig. 11

Fig. 12

— If adjustment failed, it is most probable that —

- (1) Q101, Q105, Q106, or Q151 on the Read/Write P.C.B. (or any combination there of) is defective.
- (2) The head is contaminated. Clean the head with alcohol.
(Follow the same cleaning procedure as for ACC decks.)

PASC Digital P.C.B. Check

A) Play Mode Check

- Checking the Input Signal Waveforms

1. Play program no. 34 on the Test Tape (RFKZ0032).

Connect an oscilloscope to J408 pin 7 on the PASC Digital P.C.B. and check for the following input signal waveforms (connect the scope's ground lead to the chassis ground).

Fig. 13

Fig. 14

- Checking the Output Signal Waveforms

1. Check the output waveforms at pin 42 (connect to the scope's ch. 1 probe) and pin 50 (connect to the scope's ch. 2 probe) of connector J421, which connects the PASC Digital P.C.B. to the Main P.C.B.
2. Play program no. 34 on the Test Tape (RFKZ0032) and observe the output signal waveforms. Play program no. 47 on the same tape and check to make sure that the following output waveforms are observed.

Fig. 15

Fig. 16

The playback system is functioning normally if the specified input and output waveforms are obtained at the test points.

B) Recording Mode Check

Feed the CD player output to the DIGITAL REC IN/COAXIAL jack on the DCC deck.

- **Checking the Input Signal Waveforms**

1. Connect the oscilloscope to the same test points as those used to check the playback output signal.
2. Load an **DCC blank tape (RFKZ0033)** into the DCC deck. **Play Track 1 and 3 on the test CD (SZZP1054C)** and place the deck in REC mode to record the CD test programs.
3. Check for the following input signal waveforms at the test points.

Fig. 17

Fig. 18

- **Checking the Output Signal Waveforms**

1. Connect an oscilloscope to **J408 pin 3** on the PASC Digital P.C.B. and check for the following output signal waveforms (connect the scope's ground lead to the chassis ground).

Fig. 19

Fig. 20

The recording system is functioning normally if the specified input signal waveforms are obtained at the test point.

BLOCK DIAGRAM

Notes
 • Playback signal
 • Recording signal

SCHEMATIC DIAGRAM

(Parts list on pages 67~74.)

(This schematic diagram may be modified at any time with development of new technology.)

Note 1:

- J091 : Voltage selector in "240V" position.
(110V ↔ 120V ↔ 240V ↔ 220V)
- S851 : Power switch in "on" position (POWER/ OFF = ON).
- Resistance are in ohms (Ω), 1/4 watt unless specified otherwise.
1K=1,000 (Ω), 1M=1,000k (Ω)
- Capacity are in micro-farads (μ F) unless specified otherwise.
- All voltage values shown in circuitry are under no signal condition and playback mode with volume control at minimum position otherwise specified.
- () Voltage values at record mode.
- For measurement us EVM.
- Important safety notice
Components identified by Δ mark have special characteristics important for safety. When replacing any of these components, use only manufacturer's specified parts.
- ($\rightarrow$ +B $\rightarrow$) indicates +B (bias).
- ($\rightarrow$ -B $\rightarrow$) indicates -B (bias).
- ($\rightarrow$) indicates the flow of the playback signal.
- ($\rightarrow$) indicates the flow of the record signal.

Caution!

- IC and LSI are sensitive to static electricity. Secondary trouble can be prevented by taking care during repair.
- Cover the parts boxes made of plastics with aluminum foil.
- Ground the soldering iron.
- Put a conductive mat on the work table.
- Do not touch the legs of IC or LSI with the fingers directly.

H MAIN CIRCUIT

I REC LEVEL/BALANCE CIRCUIT

K POWER TRANSFORMER CIRCUIT

L REGULATOR CIRCUIT

REGULATOR CIRCUIT

Note 3:

- S051 : Cassette tray close detection switch.
- S052 : Cassette tray open detection switch.
- S901-1~S901-3: Tape playing time detection switch.
- S902-1: DCC/ACC Tape detection switch in "DCC" position.
- S902-2: DCC Rec detection switch in "DCC REC" position.
- S971 : Mechanism Play/Stop Mode switch in "stop" position.
- S972 : Cassette half detection switch.
- S973 : ATS (Normal-CrO₂/Metal) selector switch in "normal" position.
- SD01 : Repeat switch (REPEAT).
- SD02 : Tape travel selector switch (SIDE A/B).
- SD03 : Rewind switch (REW ◀◀).
- SD04 : Fastforward switch (FF ▶▶).
- SD05 : Sklp switch (SKIP ▶◀).
- SD06 : Skip switch (SKIP ▶▶).
- SD07 : Play switch (PLAY ▶).
- SD08 : Stop switch (STOP ■).
- SD09 : Append switch (APPEND ▶■).
- SD10 : Renumber switch (RENUMBER).
- SD11 : MKR erase switch (MKR ERASE).
- SD12 : Next MKR write switch (NEXT MKR WRITE).
- SD13 : Reverse MKR write switch (REVERSE MKR WRITE).
- SD14 : Start MKR write switch (START MKR WRITE).
- SD15 : Pause switch (PAUSE ■■).
- SD16 : Record switch (REC ●).
- SD17 : Cassette tray open/close switch (OPEN/CLOSE).
- SD19 : Counter reset switch (COUNTER RESET).
- SD20 : Text Information selector switch (TEXT).
- SD21 : Counter selector switch (COUNTER).
- SD23 : Auto start MKR switch (AUTO START MKR).
- SD24 : Recording mute switch (AUTO REC MUTE ●).
- SD31 : Timer switch "off" position (TIMER).
- SD32 : Dolby NR selector switch (DOLBY NR).
- SD33 : Input selector switch (INPUT SELECTOR).

Resistance are in ohms (Ω), 1/4 watt unless specified otherwise.
1K=1,000 (Ω), 1M=1,000k (Ω)

Capacity are in micro-farads (μF) unless specified otherwise.

All voltage values shown in circuitry are under no signal condition and playback mode with volume control at minimum position otherwise specified.

() Voltage values at record mode.

For measurement us EVM.

Important safety notice

Components identified by Δ mark have special characteristics important for safety.

When replacing any of these components, use only manufacturer's specified parts.

• (—+B—) Indicates +B (bias).

• (—-B—) Indicates -B (bias).

• () indicates the flow of the playback signal.

• () indicates the flow of the record signal.

Caution!

IC and LSI are sensitive to static electricity.

Secondary trouble can be prevented by taking care during repair.

• Cover the parts boxes made of plastics with aluminum foil.

• Ground the soldering iron.

• Put a conductive mat on the work table.

• Do not touch the legs of IC or LSI with the fingers directly.

• Position of foot (Dimension: mm)

REPLACEMENT PARTS LIST

Notes: *Important safety notice:

Components identified by Δ mark have special characteristics important for safety.

Furthermore, special parts which have purposes of fire-retardant (resistors), high-quality sound (capacitors), low-noise (resistors), etc. are used.

When replacing any of components, be sure to use only manufacturer's specified parts shown in the parts list.

*The parenthesized indications in the Remarks columns specify the areas. (Refer to the cover page for area.)

Parts without these indications can be used for all areas.

*Remote Control Ass'y:

Supply period for three years from termination of production.

REPLACEMENT PARTS LIST

Notes: *Important safety notice:
 Components identified by Δ mark have special characteristics important for safety.
 Furthermore, special parts which have purposes of fire-retardant (resistors), high-quality sound (capacitors), low-noise (resistors), etc. are used.
 When replacing any of components, be sure to use only manufacturer's specified parts shown in the parts list.
 *The parenthesized indications in the Remarks columns specify the areas. (Refer to the cover page for area.)
 Parts without these indications can be used for all areas.
 *Remote Control Ass'y:
 Supply period for three years from termination of production.

Technics

CAUTION!

- 1 Connect a wrist strap (RFKZ0036) to the meter's ground terminal. Always wear a wrist strap when replacing the heads or inspecting or repairing a P.C.B. to prevent electrostatic breakdown.

Fig. 1

- 2 When removing the head FPC from the READ/WRITE P.C.B., always attach a shorting clip to the FPC to prevent electrostatic breakdown.

Fig. 2

- 3 Use the unmagnetized adjusting screw driver (RFKZ0037) for replacing the head and for AZTEC adjustment.
(The head may be damaged by an external magnetic field.)

■ PREPARATION FOR ADJUSTMENTS

• How to use Extension cables (RFKZ0029, RFKZ0030, RFKZ0031) for Adjustment

Extension cable	P.C.B. to P.C.B.
RFKZ0029	Main P.C.B. ↔ Mechanism Block (JW02/05/06) (See Fig. 3)
RFKZ0030	PASC P.C.B. ↔ Read/Write P.C.B. (See Fig. 4)
RFKZ0031	Main P.C.B. ↔ PASC Digital P.C.B. (See Fig. 4)

Fig. 3

Fig. 4

• Necessary Test tapes for each adjustment

Part No.	Name	Use
QZZCAC	10kHz Test tape	AZTEC adjustment
QZZCRD	Mirror tape	
RFKZ0033	DCC Blank tape	Optimum DCC recording current adjustment
RFKZ0032	DCC Characteristics tape	DCC playback level adjustment and Error Rate check
QZZCFM	ACC Test tape	Analog feedback adjustment
		Minimum analog output distortion adjustment
		Analog output frequency response characteristics adjustment
RFKZ0038	Dolby level tape	Dolby level adjustment
QZZCWAT	3kHz Test tape	Tape speed adjustment

• Necessary tools and measuring instruments

Tools

Unmagnetized adjusting screw driver (RFKZ0037)
CD player (EX: SL-PS700, SL-PS900 etc.)

Measuring Instruments

Oscilloscope (30MHz or Higher)
Distortion Factor Meter
Frequency Counter
Electric Volt Meter (AC/DC)

■ EXAMPLES OF PROBLEMS WHICH REQUIRE ADJUSTMENT

Problem or Repair Requiring Adjustment

Adjustment Item

■ WHAT YOU SHOULD KNOW BEFORE ADJUSTMENT

The DCC head block employs the AZTEC mechanism.
AZTEC plays an important role in stabilizing the running of the tape relative to the head.

Fig. 1

The Fixed Azimuth Tape Guidance (FATG) has a different shape above and below the tape. The upper part **A** is the guiding surface for the tape's upper edge. The slanted area of the lower part **B** is structured so that the tape moves itself upwards. The tape usually runs along the upper guiding surface **A**.

When the head has been replaced, be sure to adjust the AZTEC.

❶ Head is too low relative to the tape hub.

Fig. 2

❷ Head and tape hub are correctly aligned.

Fig. 3

❸ Head is too high relative to the tape hub.

Fig. 4

* If condition ❶ or ❸ occurs, adjust the azimuth screws to obtain the correct position (as shown in ❷).

ADJUSTMENT

1. AZTEC ADJUSTMENT

Preparations		Test Setup
Tools & Jigs	Measuring Instruments	
1. Mirror tape (QZZCRD) 2. 10kHz Test tape (QZZCAC) 3. Unmagnetized adjusting screw driver (RFKZ0037) 4. Wrist strap (RFKZ0036)	1. Oscilloscope (30MHz or higher)	 Fig. 1

• Adjustment Steps

- (1) Trigger on CH1.
- (2) Remove the tape control lever from the tray mechanism.

• Rough Adjustment

STEP 1

1. Using the Mirror tape (QZZCRD):
Adjust the Azimuth screws so that the Mirror tape (QZZCRD) runs over the center of the head.
2. Not using the Mirror tape (QZZCRD):
While playing back the 10kHz Test tape (QZZCAC), adjust the Azimuth screws to attain a peak on one channel (RCH) only.

• Fine Adjustment

STEP 2 Forward side adjustment

To adjust in the forward direction, use the right side Azimuth screw.
Do not touch the left side Azimuth screw (Fig. 5).

1. Run the 10kHz Test tape (QZZCAC) to its middle. Press a finger on the shaded area (●) and run the tape. (To keep the cassette from floating.)
2. While keeping your finger in the position given in Fig. 5. Press another finger on the head of the Supply reel cap, and turn the right side Azimuth screw to the right. (Control the range of movement to the left and right of the CH1 waveform.)

• Adjustment Points

Procedure	Reference figure
① Stop the right side Azimuth screw at the point where only the CH2 waveform starts to move A.	 Fig. 7
② Turn the Azimuth screw to the left until the point where the waveform starts to move in the opposite direction B.	 Fig. 8
③ Turn the Azimuth screw to halfway between A and B.	 Fig. 9

STEP 3 Method of verification

1. Connect the oscilloscope to the AZCHK terminal of the PASC DIGITAL P.C.B. (Fig. 11).
2. Playback the DCC Characteristics tape (RFKZ0032).
If the pulse width shown is within $150\mu\text{s}$, the adjustment is good (Fig. 10).
3. Otherwise, re-adjust starting with **STEP 1** (Refer to page 7).

Oscilloscope range $50\mu\text{s}$.

Fig. 10

Fig. 11

STEP 4 Reverse side adjustment

To adjust in the reverse direction, use the left side Azimuth screw.
Do not touch the right side Azimuth screw (Fig. 12).

1. Reverse playback the 10kHz Test tape (QZZCAC).
(Control the tape with your finger.)
2. While reverse playing and keeping your finger pressed on the Supply reel cap (to apply a load), turn the left side Azimuth screw as was done for the forward side adjustment (Fig. 13).

**• Adjustment Points**

Caution:
Keep magnetized objects away from this area.

Fig. 12

3. The method of verification is also the same.

2. OPTIMUM DCC RECORDING CURRENT ADJUSTMENT (READ/WRITE P.C.B.)

- Connect the CD player output terminal with the DCC recording terminal (either analog input, digital input, or optical input). Record the CD sound onto the DCC Blank tape (RFKZ0033). This recording gives A-time.

[How to do A-time recording]

Fig. 15

• Adjustment Steps

- (1) Put the unit in REC mode using an unrecorded section of the DCC Blank tape (RFKZ0033).
- (2) Adjust potentiometer R167 to obtain the optimum voltage on the output level of J151.

* How to find the optimum voltage

The bias current indicated on the back of the FPC of each head is found using the following formula:

$$V = I \times R151 (12\Omega)$$

Example:

When the bias current is 160mA:
 $V = 160\text{mA} \times 12\Omega = 1920\text{mV}$

Y:50mV
 X:10μs
 Probe:X10

Fig. 16

Fig. 17

(I) Method of Verification (Must be performed after adjustment.)

Overwrite with another music source part of the section that was recorded during preparation.

Fig. 18

[How to overwrite]

(II) Verification Items

Rewind the tape and play it back, and check the following at the breaks between tracks.

1. Check that A-Time is played back.
(Fails if the recording current is low.)
2. Check the Error Rate
 - ① Stop after about 25 seconds from the tape start position.
 - ② Turn off the power so that "ALL • ERR • RATE" is displayed in the service mode, and play the tape again. (Refer to page 12)
 - ③ Confirm that "00 00000000" remains on the display, although the Error Rate is momentarily worse than this at A-Time (5 seconds after the initial 25 seconds).

(III) Viewing the "Error Rate"

(1) Setting the Error Rate mode

- 1. Turn the **POWER** off. While pressing both the **STOP** key and the **PLAY** key, turn the **POWER** on.
- 2. [SERVICE MODE] is displayed.

are scrolled in order.

Press the **COUNTER** key on the DCC seven times.
ALL • ERR • RATE is displayed.

Place a pre-recorded tape into the machine and press the **PLAY** key.

- 3. Ten characters (numbers or letters) will be displayed on the display section.
This display shows the Error Rate on each of 8 CH signal tracks and the AUX CH.
The signal drop-out condition for each channel is displayed using the hexadecimal digits 0-9, A-F.

(2) Error Rate acceptability criteria

Display	Condition
"00000000" is constantly displayed for all tracks.	Normal (OK)
"01101000" is momentarily displayed for any one to three tracks (or more).	Normal (OK)
"11111111" is constantly displayed for one to three tracks (or more). Anything but "0" is displayed.	Error
"11111111" is constantly displayed for all tracks. Anything but "0" is displayed.	Error
"FFFFFFFF" is constantly displayed for all tracks.	Error

3. DCC PLAYBACK LEVEL ADJUSTMENT (READ/WRITE P.C.B. or PASC DIGITAL P.C.B.)

- The purpose of this adjustment is to feed digital signals at the specified level from the DCC RF circuit to the PASC Digital circuit.

Preparations		Test Setup
Tools & Jigs	Measuring Instruments	
1. DCC Test tape (RFKZ0032) 2. Screwdriver (—)	1. Oscilloscope (30MHz or higher)	(EX. 1)  Fig. 19 (EX. 2)  Fig. 20

• Adjustment Steps

- Play forward the DCC Test tape (RFKZ0032).
- Adjust potentiometer R135 so the voltage at J103-pin ⑦ is $1.2V_{p-p} \pm 100mV$ (Fig. 19).
(or RD MUX on the B SIDE of the PASC DIGITAL P.C.B. will do (Fig. 20).)

4. ANALOG OUTPUT LEVEL ADJUSTMENT (READ/WRITE P.C.B.)

Fig. 22

Preparations		Test Setup
Tools & Jigs	Measuring Instruments	
1. ACC Test tape (QZZCFM) 2. Screwdriver (–)	1. Oscilloscope (30MHz or higher) 2. EVM (AC Range)	Fig. 23

• Adjustment Steps

- (1) Play forward the 315Hz, 0dB test tone on the ACC Test tape (QZZCFM).
- (2) Maximize output level with potentiometers R101 (Lch) and R102 (Rch).
- (3) Reduce output level by –10dB (optimum output level) from the maximum level again with R101 and R102.

5. CONFIRMATION OF ANALOG OUTPUT DISTORTION ADJUSTMENT (READ/WRITE P.C.B.)

Preparations		Test Setup
Tools & Jigs	Measuring Instruments	
1. ACC Test tape (QZZCFM) 2. Screwdriver (–)	1. Oscilloscope (30MHz or faster) 2. Distortion Factor Meter	Fig. 24

• Adjustment Steps

- (1) Play forward the 315Hz, 0dB test tone on the ACC Test tape (QZZCFM).
- (2) Check to make sure that THD is no greater than 1.5%.
- (3) If THD is greater than 1.5%, adjust the R109 (Lch) and R110 (Rch) until it is within 1.5%.

ADJUSTMENT POINTS (MAIN P.C.B.)

Fig. 25

6. DOLBY LEVEL ADJUSTMENT (MAIN P.C.B.)

Preparations		Test Setup
Tools & Jigs	Measuring Instruments	
1. Dolby level tape (RFKZ0038)	1. EVM (AC Range)	

Fig. 26

• Adjustment Steps

- (1) While playing back the Dolby level tape (RFKZ0038), adjust the voltage at test point J601 to 338mV using R633 (Lch) and R634 (Rch) (See Fig. 25).

7. ANALOG PLAYBACK FREQUENCY RESPONSE ADJUSTMENT (MAIN P.C.B.)

Preparations		Test Setup
Tools & Jigs	Measuring Instruments	
1. ACC Test tape (QZZCFM) 2. Screwdriver (—)	1. Frequency Counter 2. EVM (AC Range)	Fig. 27

• Adjustment Steps

- Play the 1kHz and 63Hz test tones on the **ACC Test tape (QZZCFM)** and adjust potentiometers **R645** (Lch) and **R646** (Rch) until the FIXED OUT output level at 63Hz is within $0 \pm 0/-1$ dB from that at 1kHz.
- Play the 1kHz and 12.5kHz test tones on the **ACC Test tape (QZZCFM)** and adjust potentiometers **R643** (Lch) and **R644** (Rch) until the FIXED OUT output level at 12.5kHz is within $0 \pm 0/-1$ dB from at 1kHz.

(See Fig. 25)

Notes:

- During adjustment, monitor playback frequency with a Frequency Counter.
- Misalignment will affect the ACC Test tape (QZZCFM) playback frequency response.

8. TAPE SPEED ADJUSTMENT (TRAY P.C.B.)

Preparations		Test Setup
Tools & Jigs	Measuring Instruments	
1. ACC Test tape (QZZCFM) 2. Screwdriver (—)	1. Frequency Counter	Fig. 28

• Adjustment Steps

- Play forward the 3000Hz test tone on the **ACC Test tape (QZZCFM)** and adjust the signal frequency at the FIXED OUT jack to $3000\text{Hz} \pm 10\text{Hz}$ with potentiometer **RS02** (See Fig. 29).
- Play backward the 3000Hz test tone on the **ACC Test tape (QZZCFM)** and adjust the signal frequency at the FIXED OUT jack to $3000\text{Hz} \pm 10\text{Hz}$ with potentiometer **RS08** (See Fig. 29).

9. QUICK REVERSE SENSOR ADJUSTMENT (TRAY P.C.B.)

- The purpose of this adjustment is to set EOT sensor's sensitivity to the magnetic and leader portions of cassette tapes (quick reverse sensor).

Preparations		Test Setup
Tools & Jigs	Measuring Instruments	
1. ACC Blank tape (MAXELL UD-I90) (commercially available) 2. Screwdriver (—)	1. EVM (DC Range)	Fig. 29

• Adjustment Steps

- Play the leader tape portion of an **ACC Blank tape (MAXELL UD-I90)** and adjust the potential difference between **JW32** and **R031** to 1V with potentiometer **R036**.

10. PLL ADJUSTMENT (PASC DIGITAL P.C.B.)

Preparations		Test Setup
Tools & Jigs	Measuring Instruments	
1. Screwdriver (–)	1. Frequency Counter	 Fig. 30

• Adjustment Steps

- (1) Place the unit in **STOP** mode.
- (2) Adjust VCO free-running frequency (J442) to $7.5\text{ MHz} \pm 0.1\text{ MHz}$ with potentiometer R455.

Note:

- Misalignment can cause digital signal drop-out.
- Perform measurements with the digital source input (optical, coaxial) disconnected.
- Do not use the Extension cable (RFKZ0031), since the influence of external noise may cause incorrect results. Adjust again after putting the PASC and the P.C.B. back in their original positions.

11. F.L. LEVEL METER SENSITIVITY ADJUSTMENT (MAIN P.C.B.)

Preparations		Test Setup
Tools & Jigs	Measuring Instruments	
1. CD player (with optical output) 2. CD Test disc (SZZP1054C) 3. DCC Blank tape (RFKZ0033)	1. Nothing	 Fig. 31

• Adjustment Steps

- (1) Load a **DCC Blank tape (RFKZ0033)** in the unit under test and place it in **REC PAUSE** mode.
- (2) Load the **CD Test disc (SZZP1054C)** in the CD player and play the second band (1 kHz, 0dB, L+R signal).
- (3) Adjust potentiometers **RL05 (Lch)** and **RL06 (Rch)** so the DCC unit's FL level meters indicate 0 to –2dB (See Fig. 25).

Other potentiometers (R117 on Read/Write P.C.B. or R633, R634 on Main P.C.B.) require no service adjustment.

■ EXAMPLES OF PROBLEMS WHICH REQUIRE ADJUSTMENT

■ WHAT YOU SHOULD KNOW BEFORE ADJUSTMENT

The DCC head block employs the AZTEC mechanism. AZTEC plays an important role in stabilizing the running of the tape relative to the head.

The Fixed Azimuth Tape Guidance (FATG) has a different shape above and below the tape. The upper part **A** is the guiding surface for the tape's upper edge. The slanted area of the lower part **B** is structured so that the tape moves itself upwards. The tape usually runs along the upper guiding surface **A**.

When the head has been replaced, be sure to adjust the AZTEC.

① Head is too low relative to the tape hub.

② Head and tape hub are correctly aligned.

③ Head is too high relative to the tape hub.

* If condition ① or ③ occurs, adjust the azimuth screws to obtain the correct position (as shown in ②).

• Front Panel

• Rear Panel

• P.C.B. Location

- Ⓐ READ/WRITE P.C.B.
- Ⓑ PASC DIGITAL P.C.B.

- Ⓓ MAIN P.C.B.

ADJUSTMENT

1. AZTEC ADJUSTMENT

Preparations		Test Setup
Tools & Jigs	Measuring Instruments	
1. Mirror tape (QZZCRD) 2. 10kHz Test tape (QZZCAC) 3. Unmagnetized adjusting screw driver (RFKZ0037) 4. Wrist strap (RFKZ0036)	1. Oscilloscope (30MHz or higher)	 Fig. 1

• Adjustment Steps

- (1) Trigger on CH1.
- (2) Remove the tape control lever from the tray mechanism.

• Rough Adjustment

STEP 1

1. Using the Mirror tape (QZZCRD):
Adjust the Azimuth screws so that the Mirror tape (QZZCRD) runs over the center of the head.
2. Not using the Mirror tape (QZZCRD):
While playing back the 10kHz Test tape (QZZCAC), adjust the Azimuth screws to attain a peak on one channel (RCH) only.

• Fine Adjustment

STEP 2 Forward side adjustment

To adjust in the forward direction, use the right side Azimuth screw.
Do not touch the left side Azimuth screw (Fig. 5).

1. Run the 10kHz Test tape (QZZCAC) to its middle. Press a finger on the shaded area (●) and run the tape. (To keep the cassette from floating.)
2. While keeping your finger in the position given in Fig. 6. Press another finger on the head of the Supply reel cap, and turn the right side Azimuth screw to the right. (Control the range of movement to the left and right of the CH1 waveform.)

• Adjustment Points

Procedure	Reference figure
① Stop the right side Azimuth screw at the point where only the CH2 waveform starts to move A.	 Fig. 7
② Turn the Azimuth screw to the left until the point where the waveform starts to move in the opposite direction B.	 Fig. 8
③ Turn the Azimuth screw to halfway between A and B.	 Fig. 9

STEP 3 Method of verification

1. Connect the oscilloscope to the AZCHK terminal of the PASC DIGITAL P.C.B. (Fig. 11).
2. Playback the DCC Characteristics tape (DCC-S1).
If the pulse width shown is within 150 μ sec, the adjustment is good (Fig. 10).
3. Otherwise, re-adjust starting with **STEP 1** (Refer to page 7).

Fig. 10

Fig. 11

STEP 4 Reverse side adjustment

To adjust in the reverse direction, use the left side Azimuth screw.
Do not touch the right side Azimuth screw (Fig. 12).

1. Reverse playback the 10kHz Test tape (QZZCAC).
(Control the tape with your finger.)
2. While reverse playing and keeping your finger pressed on the Supply reel cap (to apply a load), turn the left side Azimuth screw as was done for the forward side adjustment (Fig. 13).

Fig. 13

• Adjustment Points

Top view of the head block

Caution:

Keep magnetized objects away from this area.

Caution:
Don't touch!

Reverse Play Azimuth screws

Fig. 12

3. The method of verification is also the same.

2. OPTIMUM DCC RECORDING CURRENT ADJUSTMENT (READ/WRITE P.C.B.)

- Connect the CD player output terminal with the DCC recording terminal (either analog input, digital input, or optical input). Record the CD sound onto the DCC Blank tape (RFKZ0033). This recording gives A-time.

[How to do A-time recording]

• Adjustment Steps

- Put the unit in REC mode using an unrecorded section of the DCC Blank tape (RFKZ0033).
- Adjust potentiometer R167 to obtain the optimum voltage on the output level of J151.

* How to find the optimum voltage

The bias current indicated on the back of the FPC of each head is found using the following formula:

$$V = I \times R151 \text{ (12}\Omega\text{)}$$

Example:

When the bias current is 160mA:

$$V = 160\text{mA} \times 12\Omega = 1920\text{mV}$$

Y:50mV
X:10 μ s
Probe:X10

Fig. 16

Fig. 17

(I) Method of Verification (Must be performed after adjustment.)

Overwrite with another music source part of the section that was recorded during preparation.

Fig. 18

[How to overwrite]**(II) Verification Items**

Rewind the tape and play it back, and check the following at the breaks between tracks.

1. Check that A-Time is played back.
(Fails if the recording current is low.)
2. Check the Error Rate
 - ① Stop after about 25 seconds from the tape start position.
 - ② Turn off the power so that "ALL • ERR • RATE" is displayed in the service mode, and play the tape again. (Refer to page 12)
 - ③ Confirm that "00 00000000" remains on the display, although the Error Rate is momentarily worse than this at A-Time (5 seconds after the initial 25 seconds).

(III) Viewing the "Error Rate"**(1) Setting the Error Rate mode**

1. Turn the **POWER** off. While pressing both the **STOP** key and the **PLAY** key, turn the **POWER** on.
2. [SERVICE MODE] is displayed.

' + ' + - , / 0 1 2 3 4 5 6 7 8 9
< = > 7 A B C D E F G H I J K L M N
O P Q R S T U V W X Y Z

are scrolled in order.

Press the **COUNTER** key on the DCC seven times.
ALL • ERR • RATE is displayed.

Place a pre-recorded tape into the machine and press the **PLAY** key.

3. Ten characters (numbers or letters) will be displayed on the display section.
This display shows the Error Rate on each of 8 CH signal tracks and the AUX CH.
The signal drop-out condition for each channel is displayed using the hexadecimal digits 0-9, A-F.

Aux CH	CH	1	2	3	4	5	6	7	8
00		0	0	0	0	0	0	0	0
		}							
		9							
		A							
		}							
		F	F	F	F	F	F	F	F

(2) Error Rate acceptability criteria

Display	Condition
"00000000" is constantly displayed for all tracks.	Normal (OK)
"01101000" is momentarily displayed for any one to three tracks (or more).	Normal (OK)
"11111111" is constantly displayed for one to three tracks (or more). Anything but "0" is displayed.	Error
"11111111" is constantly displayed for all tracks. Anything but "0" is displayed.	Error
"FFFFFFFF" is constantly displayed for all tracks.	Error

3. DCC PLAYBACK LEVEL ADJUSTMENT (READ/WRITE P.C.B. or PASC DIGITAL P.C.B.)

- The purpose of this adjustment is to feed digital signals at the specified level from the DCC RF circuit to the PASC Digital circuit.

Preparations		Test Setup
Tools & Jigs	Measuring Instruments	
1. DCC Test tape (DCC-S1). 2. Screwdriver (—)	1. Oscilloscope (30MHz or higher)	(Ex. 1)  Fig. 19 (EX. 2)  Fig. 20

• Adjustment Steps

- Play forward the DCC Test tape (DCC-S1).
- Adjust potentiometer R135 so the voltage at J103-pin ⑦ is $1.2V_{p-p} \pm 100mV$ (Fig. 19).
(or RD MUX on the B SIDE of the PASC DIGITAL P.C.B. will do (Fig. 20).)

Fig. 21

4. ANALOG OUTPUT LEVEL ADJUSTMENT (READ/WRITE P.C.B.)

Fig. 22

Preparations		Test Setup
Tools & Jigs	Measuring Instruments	
1. ACC Test tape (QZZCFM) 2. Screwdriver (–)	1. Oscilloscope (30MHz or higher) 2. EVM (AC Range)	

Fig. 23

• Adjustment Steps

- (1) Play forward the 315Hz, 0dB test tone on the ACC Test tape (QZZCFM).
- (2) Maximize output level with potentiometers R101 (Lch) and R102 (Rch).
- (3) Reduce output level by –10dB (optimum output level) from the maximum level again with R101 and R102.

5. CONFIRMATION OF ANALOG OUTPUT DISTORTION ADJUSTMENT (READ/WRITE P.C.B.)

Preparations		Test Setup
Tools & Jigs	Measuring Instruments	
1. ACC Test tape (QZZCFM) 2. Screwdriver (–)	1. Oscilloscope (30MHz or faster) 2. Distortion Factor Meter	

Fig. 24

• Adjustment Steps

- (1) Play forward the 315Hz, 0dB test tone on the ACC Test tape (QZZCFM).
- (2) Check to make sure that THD is no greater than 1.5%.
- (3) If THD is greater than 1.5%, adjust the R109 (Lch) and R110 (Rch) until it is within 1.5%.

ADJUSTMENT POINTS (MAIN P.C.B.)

Fig. 25

6. DOLBY LEVEL ADJUSTMENT (MAIN P.C.B.)

Preparations		Test Setup
Tools & Jigs	Measuring Instruments	
1. Dolby level tape (RFKZ0038)	1. EVM (AC Range)	J601 Main P.C.B. EVM

Fig. 26

• Adjustment Steps

- (1) While playing back the Dolby level tape (RFKZ0038), adjust the voltage at test point J601 to 33mV using R633 (Lch) and R634 (Rch) (See Fig. 25).

7. ANALOG PLAYBACK FREQUENCY RESPONSE ADJUSTMENT (MAIN P.C.B.)

Preparations		Test Setup
Tools & Jigs	Measuring Instruments	
1. ACC Test tape (QZZCFM) 2. Screwdriver (—)	1. Frequency Counter 2. EVM (AC Range)	 Fig. 27

• Adjustment Steps

- Play the 1kHz and 63Hz test tones on the **ACC Test tape (QZZCFM)** and adjust potentiometers **R645** (Lch) and **R646** (Rch) until the FIXED OUT output level at 63Hz is within $0 \pm 0/-1$ dB from that at 1kHz.
- Play the 1kHz and 12.5kHz test tones on the **ACC Test tape (QZZCFM)** and adjust potentiometers **R643** (Lch) and **R644** (Rch) until the FIXED OUT output level at 12.5kHz is within $0 \pm 0/-1$ dB from at 1kHz.

(See Fig. 25)

Notes:

- During adjustment, monitor playback frequency with a Frequency Counter.
- Misalignment will affect the ACC Test tape (QZZCFM) playback frequency response.

8. TAPE SPEED ADJUSTMENT (TRAY P.C.B.)

Preparations		Test Setup
Tools & Jigs	Measuring Instruments	
1. ACC Test tape (QZZCWAT). 3kHz – 10dB 2. Screwdriver (—)	1. Frequency Counter	 Fig. 28

• Adjustment Steps

- Play forward the 3000Hz test tone on the **ACC Test tape (QZZCWAT)** and adjust the signal frequency at the FIXED OUT jack to $3000\text{Hz} \pm 10\text{Hz}$ with potentiometer **RS02** (See Fig. 29).
- Play backward the 3000Hz test tone on the **ACC Test tape (QZZCWAT)** and adjust the signal frequency at the FIXED OUT jack to $3000\text{Hz} \pm 10\text{Hz}$ with potentiometer **RS08** (See Fig. 29).

9. QUICK REVERSE SENSOR ADJUSTMENT (TRAY P.C.B.)

- The purpose of this adjustment is to set EOT sensor's sensitivity to the magnetic and leader portions of cassette tapes (quick reverse sensor).

Preparations		Test Setup
Tools & Jigs	Measuring Instruments	
1. ACC Blank tape (MAXELL UD-I90) (commercially available) 2. Screwdriver (—)	1. EVM (DC Range)	 Fig. 29

• Adjustment Steps

- Play the leader tape portion of an **ACC Blank tape (MAXELL UD-I90)** and adjust the potential difference between JW32 and R031 to 1V with potentiometer **R036**.

10. PLL ADJUSTMENT (PASC DIGITAL P.C.B.)

Preparations		Test Setup
Tools & Jigs	Measuring Instruments	
1. Screwdriver (–)	1. Frequency Counter	 Fig. 30

• Adjustment Steps

- (1) Place the unit in **STOP** mode.
- (2) Adjust VCO free-running frequency (J442) to $7.5\text{MHz} \pm 0.1\text{MHz}$ with potentiometer R455.

Note:

- Misalignment can cause digital signal drop-out.
- Perform measurements with the digital source input (optical, coaxial) disconnected.
- Do not use the Extension cable (RFKZ0031), since the influence of external noise may cause incorrect results. Adjust again after putting the PASC and the P.C.B. back in their original positions.

11. F.L. LEVEL METER SENSITIVITY ADJUSTMENT (MAIN P.C.B.)

Preparations		Test Setup
Tools & Jigs	Measuring Instruments	
1. CD player (with optical output) 2. CD Test disc (SZZP1054C) 3. DCC Blank tape (RFKZ0033)	1. Nothing	 Fig. 31

• Adjustment Steps

- (1) Load a **DCC Blank tape (RFKZ0033)** in the unit under test and place it in **REC PAUSE** mode.
- (2) Load the **CD Test disc (SZZP1054C)** in the CD player and play the second band (1 kHz, 0dB, L+R signal).
- (3) Adjust potentiometers RL05 (Lch) and RL06 (Rch) so the DCC unit's FL level meters indicate 0 to –2dB (See Fig. 25).

Other potentiometers (R117 on Read/Write P.C.B. or R633, R634 on Main P.C.B.) require no service adjustment.

12. DCC TEST FIXTURE LIST

Appearance	Part No.	Description
Extension Cable  (Dec. '92)	RFKZ0029	Used for checking Tray P.C.B.
Extension FPC  (Dec. '92)	RFKZ0030	Used for checking Read/Write P.C.B.
Extension Cable  (Dec. '92)	RFKZ0031	Used for checking Pasc P.C.B.
Wrist strap (F-50)  (Dec. '92)	RFKZ0036	Discharge static electricity from body
Screw Driver (D-281)  (Dec. '92)	RFKZ0037	Head Azimuth adjustment

Appearance	Part No.	Description
 (Dec. '92)	DCC-S1	Test Tape
 (Dec. '92)	RFKZ0033	Blank Tape
 (Design should be changed) (Dec. '92)	RFKZ0034	Music Tape (848 981-5)

《Troubleshooting Method》

How to connect the REKZ0030 Junction board and easy to confirm the Record/Playback envelopes.

13. TROUBLESHOOTING & QUICK SERVICE INFORMATION

RS-DC10 Trouble Examples

Symptom	Cause	Remedy
1) Tray sometimes opens.	Connector (JW06) inserted incompletely.	Insert it completely.
2) No sound is heard at times.	Same as above.	Same as above.
3) Tape fails to come out.	Connector (JW05)	Insert it again.
4) Unit cannot be turned ON.	Open of diode (D812).	Replace it with a new one.
5) Only DCC the not read.	Shutter OPEN/CLOSE lever return spring slipped off.	Repair it.
6) No headphone output.	Open of RH02	Replace it with a new one.
7) Tray closed opens soon.	Control board out of position.	Correct it.
8) No recording can be made with other manufacturer's optical input. Pioneer CLD303/CLD939 Sony ZS-F1	Pitch shift clock mode of some other appliance's digital output is out of standard.
