NOTE:

THE MODEL SA-8500 COMES IN THREE VERSIONS DISTINGUISHED AS FOLLOWS:

Round label on rear panel	Voltage	Type
KCU	120V only	UL (U.S.A.) and CSA (Canada) approved.
FV	110V, 120V, 130V, 220V, and 240V (switchable)	General export model. SEV (Switzerland) approved.
GN	220V only	SEMKO (Sweden), DEMKO (Denmark), NEMKO (Norway) and EI (Finland) approved.

(IHF, short-circuited, A Network)	100dB
--	-------

Preamplifier Section

Circuitry

Equalizer amplifier	3-stage direct-coupled amplifier.
Control amplifier	2-stage direct-coupled NFB type.

Input : Sensitivity/Impedance

PHONO 1	2.5mV/50k ohms
PHONO 2	2.5mV~5mV/50k ohms
MIC	7.5mV~15mV/85k ohms
TUNER	150mV/50k ohms
AUX	150mV/50k ohms
TAPE PB 1	150mV/50k ohms
TAPE PB 2	150mV/50k ohms
TAPE PB 2 (DIN connector)	150mV/50k ohms

PHONO Overload Level (T.H.D 0.1%)

PHONO 1	200mV (1,000 Hertz)
PHONO 2	200mV~400mV (1,000 Hertz)

Output : Level/Impedance

TAPE REC 1	150mV
TAPE REC 2 (DIN connector)	30mV/80k ohms
PRE OUT	1V/1k ohms

Total Harmonic Distortion at

20 Hertz to 20,000 Hertz. . .	No more than 0.05%
-------------------------------	--------------------

Frequency Response

PHONO (RIAA equalization). 30 Hertz to 15,000 Hertz ± 0.3 dB	
TUNER, AUX, TAPE PB. . . .	7 Hertz to 40,000 Hertz ± 1 dB

Tone Control

BASS	SUB ± 6 dB by 2dB step (50 Hertz) MAIN ± 8 dB by 2dB step (100 Hertz)
TREBLE	SUB ± 6 dB by 2dB step (20,000 Hertz) MAIN ± 8 dB by 2dB step (10,000 Hertz)

Filter

LOW	30 Hertz (12dB/oct)
HIGH	8,000 Hertz (12dB/oct)

Loudness Contour

(Volume control set at -40dB position)	+8.5dB (100Hz) +4dB (10,000Hz)
---	-----------------------------------

Hum and Noise (IHF, Short-circuited, A Network)

PHONO 1 and 2	70dB
MIC	65dB
TUNER, AUX, TAPE PB. . . .	90dB

Muting	0, -20dB
------------------	----------

Miscellaneous

Power Requirements	AC 120V 60 Hertz or 220V 50/60 Hertz or 110, 120, 130, 220 and 240V (Switchable) 50/60 Hertz
------------------------------	---

Power Consumption	240 watts
-----------------------------	-----------

Dimensions	420 (W) x 150 (H) x 345 (D) mm 16-9/16 x 5-7/8 x 13-9/16 in.
----------------------	---

Weight : Without Package . . .	13kg (29 lb 11oz)
With Package	14.5kg (31 lb 4 oz)

Connection Cord with Pin Plugs .	1
Operating Instructions	1
Fuse 2.5A	1
Fuse 5A	1 (5-line voltage model)

NOTE:

Specifications and the design subject to possible modification without notice due to improvements.

2. FRONT PANEL FACILITIES

BASS TWIN CONTROL

Adjusts low frequency tone.

100 Hz: Adjusts frequency band below 400Hz. Control effectiveness at 100Hz is $\pm 8\text{dB}$ by 2dB step.

50Hz: Provides additional control to the 100Hz knob for the frequency band below 200Hz. Control effectiveness at 50Hz is $\pm 6\text{dB}$ by 2dB step.

PILOT LAMP

When set to OFF, the tone control circuit is disengaged and a flat frequency response obtained. The tone controls (BASS & TREBLE) do not function in this case. This switch is convenient for various kinds of checking, including cartridge and speaker tone, tone control effectiveness, and listening room acoustics.

POWER SWITCH

Lights to indicate power ON.

PHONES JACK

Plug stereo headphones into this jack for private listening.

NOTE:

Set the **SPEAKERS** switch to OFF when listening through the headphones only.

SPEAKERS SWITCH

OFF: Speaker sound cut off

A: Activates speakers connected to the 'A' SPEAKERS terminals

B: Activates speakers connected to the 'B' SPEAKERS terminals

A + B: Sound obtained from both A and B speaker systems

NOTE:

Set switch to OFF when listening only through headphones, or to temporarily interrupt the sound.

TREBLE TWIN CONTROL

Adjusts high frequency tone.

10kHz: Adjusts frequency band above 2.5kHz. Control effectiveness at 10kHz is $\pm 8\text{dB}$ by 2dB step.

20kHz: Provides additional control to the 10kHz knob for the frequency band above 5kHz. Control effectiveness at 20kHz is $\pm 6\text{dB}$ by 2dB step.

VOLUME CONTROL

Adjusts volume from speakers or headphones. Clockwise rotation increases volume.

BALANCE CONTROL

Adjusts relative volume between left and right speaker systems or headphones. Clockwise rotation from center increases right channel volume, while counter-clockwise rotation increases left channel volume.

MIC/PHONO 2 LEVEL CONTROL

Adjusts sensitivity to PHONO 2 jacks and MIC jack.

FUNCTION SWITCH

Selects desired program source for listening.

PHONO 1: For playing records on a turntable connected to the PHONO 1 jacks.

MIC/PHONO 2: Same as above, for PHONO 2, or for reproduction through a microphone connected to the MIC jack on the rear panel. Note, when the microphone is connected to the jack, the turntable connected to the PHONO 2 jacks cannot be used.

TUNER: For listening to broadcasts through the tuner.

AUX: For playing signals fed to the AUX jacks.

TAPE DUPLICATE SWITCH

Set to ON when employing 2 tape decks to duplicate or edit recorded tapes.

LOW FILTER SWITCH

Set to ON if low frequency noise, such as motor rumble or hum etc., becomes objectionable.

HIGH FILTER SWITCH

Set to ON if high frequency noise, such as record scratch noise etc., becomes objectionable.

MODE SWITCH

STEREO REV: Reverses left and right channels of a stereo signal and presents them stereo-phonically.

STEREO NORM: Set to this position for normal stereo listening.

MONO L + R: Left and right channels of the input signal are mixed and presented monophonically.

MONO L: Left channel input signal is presented monophonically from both left and right speakers.

MONO R: Right channel input signal is presented monophonically from both left and right speakers.

LOUDNESS SWITCH

When listening at low volume, set this switch to ON to enhance low and high frequencies. The human ear possesses different characteristics when listening to low and high volume sounds. The LOUDNESS switch compensates for these characteristics.

MUTING SWITCH

Reduces volume by 20dB. Employ for temporarily reducing the volume, as when changing records or tapes. This eliminates the need for repeatedly adjusting the VOLUME control.

TAPE MONITOR SWITCH

1: To perform tape playback or monitoring of tape deck connected to the TAPE 1 (REC & PB) jacks.

SOURCE: Set to this position when not playing tape.

2: To perform tape playback or monitoring of tape deck connected to the TAPE 2 (REC & PB) jacks.

NOTE:

Be sure to set this switch to SOURCE when employing turntable or tuner. Sound will not be obtained from the speakers at positions 1 and 2 in these cases.

3. CONNECTION DIAGRAM

LINE VOLTAGE AND FUSE

SA-8500 amplifiers are designed to accept different line voltages, according to the country in which they are to be used, although the operation of the various models in the same in every other respect. The line voltage connection is on the rear panel, CONNECTION DIAGRAM shows the line voltage of a 120V only model. Fig. A shows the line voltage connection of a model designed to operate at 220V only.

Fig. B shows the line voltage selector and fuse of a model designed to operate at any of five pre-selected voltages (110V, 120V, 130V, 220V, 240V).

CHANGING LINE VOLTAGE SETTING AND FUSE

To remove the fuse, unscrew the fuse cap located in the center of the line voltage selector and withdraw it, together with the fuse. Next, pull the line voltage selector plug out of its socket, rotate it until the cutaway aligns with the appropriate line voltage marked on the back of the unit, then push it back into its socket. It is important to check the rating of the fuse; a 2.5A fuse should be used with either 220V or 240V, while a 5A fuse should be used for 110V, 120V or 130V operation. If the fuse rating is correct, replace it and screw in the fuse cap.

FUSE REPLACEMENT

When the fuse blows, remove the fuse cap and replace the fuse with a new one. Fig. C.

Fig. C

4. CIRCUIT DESCRIPTION

The SA-8500 is a 2-channel integrated stereo amplifier.

The descriptions given here refer mainly to the left channel. Please refer to the block diagram on pages 11 to 12.

Equalizer Amplifier (Q1 – Q3)

This amplifier amplifies the low level signals from the cartridge and microphone inputs. Equalization is performed in accordance with the RIAA curve. This is a three-stage, direct-coupled, collector-to-emitter feedback type, consisting of transistors Q1 – Q3.

By using the balanced power supply, both the input and output voltages can be lowered, and the charge potential of coupling capacitor becomes reduced. As a result, the shock noise which occurs in changing the switch are reduced. The gain is 35.5dB at 1kHz, the deviation from the RIAA standard is $\pm 0.3\text{dB}$ (from 30Hz to 15kHz) and the overload level is 200mV rms at 1kHz.

Tone Control Amplifier (Q4 – Q7)

This circuit amplifies the signals from the equalizer and the input signals it from TUNER terminals and TAPE PB terminals, and then feeds the amplified signals to the power amplifier. And also, the tone controls are performed here. This is of the NFB type, employing balanced power supply. The circuit consisting of Q4 and Q5 is 2-stage direct-coupled circuit. Here, the signals are raised to sufficient level for driving the power amplifier.

The description given here refer to the sub tone control circuit.

1. LOW FREQUENCY CONTROL

The low frequency control circuit is shown in Fig. 1-a, and the equivalent circuit, when boosting low frequency, is shown in Fig. 1-b.

As the parallel impedance of VR1 and C10, in Fig. 1-b, is high at low frequency, the volume of the NFB decreases and the gain in the low frequency range increases. The equivalent circuit, when cutting out low frequencies, is shown in Fig. 1-c. In this case, the input signal is applied to Q6, through the parallel impedance of VR1 and C9, which is high in the low frequency range and suppresses the lower frequency signals.

Fig. 1-a

Fig. 1-b

Fig. 1-c

2. HIGH FREQUENCY CONTROL

The high frequency control circuit is shown in Fig. 2-a, and the equivalent circuit, when boosting high frequencies, is shown in Fig. 2-b.

In this circuit, the input signal is applied to Q6 through the parallel impedance circuit. This impedance is small in the high frequency range and produces a signal with an enhanced high range. Fig. 2-c shows the equivalent circuit when cutting out high frequencies. As the impedance of R10, R11 and C11 of the circuit becomes small, the level of the NFB increases and the gain of the circuit decreases.

Main tone control circuit is the same as the above description.

Fig. 2-a

Fig. 2-b

Fig. 2-c

Filter Circuit (Q8)

The circuit shown in Fig.3. has a steep characteristic of 12dB/oct, and is effective in removing noise. The low cutout filter can be switched to the two positions of OFF 30 Hz. Change-over of this cut-off frequency is achieved by changing over C1 and C2. The high cutout filter can be switched to the two positions of OFF and 8kHz, and this is achieved by the changeover of C3 and C4.

Fig. 3

Power Amplifier (Q9 – Q17)

The power amplifier of the SA-8500 is an all-stage direct-coupled pure complementary, OCL circuit; with direct coupling at all stages, employing a differential amplifier and bias compensation circuit to stabilize the operating point. The differential amplifier, consisting of Q9 and Q10 in the first stage, amplifies the input signal and stabilizes the voltage of the junction point of the power stage.

Since the base voltage of Q9 is a reference for the voltage of the junction point of the power stage, the bias compensation circuit is provided in the base circuit of Q9. The silicon diode, D1 is used to compensate temperature.

VR1 is provided to adjusting the base voltage of Q9 to 0 volt, resulting in, zero voltage at the junction point of the power stage. Q11 is a voltage amplifier, which drives the next complementary stage. Due to the boot-strap circuit inserted in the load to Q11, the voltage gain of Q11 becomes large. The NFB is applied to the base of Q10 by R14 and C3. The entire DC is also applied to the base of Q10 through R13, thus stabilization of the output midpoint potential is secured. The AC NFB is determined by the split circuit of R13 and R14 to improve the characteristics.

Fig. 4

Protection Circuit (Q18–Q24)

This protection circuit functions to protect the speakers from damage due to short-circuit of the load, etc., and performs a muting operation to cut noise and distortion which occur when switching the power on and off.

The circuit is shown in Fig.5, and consists of a bridge type over-current and overload detector, a differential amplifier DC voltage detector, and a power switch on/off detector section.

Fig. 5

1. OVER-CURRENT AND OVERLOAD DETECTION

The equivalent circuit of this detector section is shown in Fig. 6-a, and Fig. 6-b shows the equivalent circuit at the time of a positive half cycle. When this equivalent circuit is overloaded, the balance of the bridge, formed by RE1, R1, R5 and RL, is disturbed, and a potential is produced between d and b in such a direction that Q18 is turned on.

As Q18 is turned on, the collector current increases, the relay driving circuit functions and the relay switch of the output circuit is turned off. After the cause of the overload is removed, the bias of Q18 is reduced and the relay switch turns on to automatically restore normal operation, Fig. 6-c shows the equivalent circuit at the time of a negative half cycle. In this circuit a potential is produced between b and e as above, and Q18 is turned on.

2. DETECTION OF DC VOLTAGE

This is a differential amplifier consisting of Q20 and Q21, as shown in Fig. 7. The bases of Q20 and Q21 are connected to the junction points of the right and left power amplifiers. When the DC balance of the power stage is lost for some reason, a potential difference is produced in the input signal to the differential amplifier, and the collector currents of Q20 and Q21 are put out of balance. Thus, the relay driving circuit functions, and the relay switch is turned off.

3. RELAY DRIVING CIRCUIT

Q22 — Q24, in Fig. 5, comprise the relay driving circuit.

In the normal condition reverse bias is applied to the base of Q22, and Q22 is in a cut-off condition. When one of the above mentioned detection circuits operates, current flows through R18, the base potential falls and Q22 is switched on. Consequently Q23 comes on and Q24 goes off. When Q24 goes off, the current of the relay circuit is switched off, to release the switch of the output circuit.

When the power switch is turned on, a delay occurs in this circuit R25, R26 and C6, in the base circuit of Q24, are the time constant elements which determine the delay time. When the power is switched on, C6 charges to a potential of +35 volts through R25 and R26, and Q24 is kept in the OFF condition during this time. When the power source is switched off the muting operation of Q23 prevents shock noise. In the normal condition, potentials of +35 volts and -5.1 volts are applied to Q23 through R21 and R22, and resultant

potential at the base of Q23 is -1 volt, keeping it in the cut-off condition. When the power supply is turned off, the potential of -5.1 volts disappears immediately, due to the small time constant of the power circuit. Thus a positive base potential remains, switching Q23 on, which in turn switches off Q24 and hence the relay.

Fig. 6-a

Fig. 6-b

Fig. 6-c

Fig. 7

Power Supply Circuit (Q25-Q27)

The SA-8500 uses a balanced power supply with a built-in constant potential circuit. Apart from the pre-driver stage, all other components are in constant potential condition. Therefore, not only is operating stability superior, but it is effective in reducing residual noise.

The power source, after the pre-driver stage of the amplifier circuit, is provided by the bridge rectifier circuit and the 15,000μ F capacitor.

5. LEVEL DIAGRAM

6. BLOCK DIAGRAM

7. DISASSEMBLY

1. Removing the Top Cover

Remove the 2 screws on each side of the top cover.

2. Removing the Front Panel

1. Remove all control knobs by pulling them out.
2. Remove the 2 screws each from the top and bottom edges of the front panel.

3. Removing the Bottom Plate

Remove the 10 screws to detach the bottom plate.

4. Removing the Equalizer Amplifier Assembly

- 1. Remove the top cover and front panel.
- 2. Remove the 5 screws which mount the printed circuit board on chassis.

5. Removing the Control Amplifier Assembly

1. Remove the top cover and front panel.
2. Remove the 4 screws which mount the printed circuit board on chassis.

6. Removing the Power Amplifier Assembly

1. Remove the top cover and bottom plate.
2. Remove the 7 screws which mount the printed circuit board on chassis.

7. Removing the Switch Circuit Assembly

1. Remove the front panel and bottom plate.
2. Remove the 9 screws which mount the printed circuit board on the chassis.

8. ADJUSTMENTS

Set-up

- (a) Remove the top cover.
- (b) Before turning on the POWER switch, turn VR1 and VR2 all the way to the left (counter-clockwise).
- (c) For adjustment, wait 10 minutes after the POWER switch is turned on.

8.1 ADJUSTMENT FOR JUNCTION POINT

1. Connect as shown in Fig.8.
2. Adjust VR3 (left channel, VR4: for right channel) until the DC voltmeter indicates 0V.

8.2 ADJUSTMENT FOR IDLE CURRENT

1. Connect as shown in Fig.9.
2. Adjust VR1 (left channel, VR2: for right channel) until the DC voltmeter indicates 30mV.
